

Machined needle roller bearings

Technical Product Information

Welcome to the Future! Unmatched Engineering Excellence. INA & FAG

Partner Power

X-life – this is the new premium grade from INA and FAG, offering you new opportunities for success. Benefit from the combined expertise of two rolling bearing manufacturers with a worldwide reputation – in every area of application covering automotive, machine building and precision engineering.

INA and FAG have brought together their strengths to give a new dimension in quality:

X-life.

Higher cost-effectiveness.

Higher operational security.

What X-life offers:

X-life offers excellent product quality that far exceeds previous standards.

Furthermore, X-life optimises all the parameters that are decisive for a problem-free production cycle. This includes correct fitting and dismantling, maintenance intervals matched to the specific application and the selection of lubricants matched to operating conditions.

A further convincing advantage of X-life is product characteristics that fulfil your specific requirements and offer additional benefits: for example, particularly low-noise, maintenance-friendly or high load capacity system solutions.

Your X-life advantages at a glance:

- product characteristics far above the norm
- lasting quality assurance and control
- extremely high reliability
- even greater security in planning and systems
- optimum availability
- smooth-running working processes
- reduced energy consumption
- the maximum possible cost-effectiveness
- the maximum possible level of service and support

Higher cost-effectiveness and operational security with X-life

Due to their excellent technical characteristics such as high radial load carrying capacity together with their suitability for high speeds, single and double row INA machined needle roller bearings have been used with outstanding success for decades in numerous different applications. With the X-life generation of these needle roller bearings, the performance capacity of the products up to 120 mm outside diameter has once more been significantly increased.

Advantages of the new design

The use of state of the art manufacturing technologies has resulted in a better, more uniform surface over the whole contact face between the rolling elements and raceway.

As a result, under identical load there is a significant reduction in the stress conditions present on the rolling elements and raceway, see *Figure 1* and *Figure 2*. The improved surface quality gives reduced friction and lower bearing temperatures, running resistance is lower and less strain is placed on the grease.

Taken together, these improvements mean that the basic dynamic load ratings C_r are approximately 13% higher than the values for the standard design.

As a result, the basic rating life is therefore increased by more than 50%; i.e., the operating life of the bearings is considerably longer under the same operating conditions, see *Figure 3*.

Alternatively, higher loads can now be applied while maintaining the same life values.

With their optimised characteristics, X-life needle roller bearings open up completely new application prospects, such as downsizing of the bearing arrangement. Furthermore, the improved price/performance ratio ultimately increases the overall cost-effectiveness of the bearing arrangement.

Machined needle roller bearings

X-life®

Needle roller bearings with ribs

4

In needle roller bearings with ribs, the outer ring combined with the needle roller and cage assembly form a self-retaining unit. These rolling bearings with low radial section height and high load carrying capacity are particularly suitable for designs with a limited radial design envelope.

The bearings are available with and without an inner ring and in both sealed and open versions.

Bearings without an inner ring are the best solution for bearing arrangements where the shaft can be hardened and ground.

Needle roller bearings with inner ring are used if the shaft cannot be configured as a rolling bearing raceway.

X-life®

Needle roller bearings without ribs

26

Needle roller bearings without ribs on the outer ring are not self-retaining. This means that the outer ring, needle roller and cage assembly and inner ring can be fitted independently of each other. This makes fitting of the bearings considerably easier.

Needle roller bearings are available with and without an inner ring and in both single and double row versions.

Bearings without an inner ring are used if the shaft can be hardened and ground.

X-life®

Aligning needle roller bearings

36

Aligning needle roller bearings have a raceway ring with a spherical outside surface and a concave support ring. As a result, they can compensate for static misalignment of the bearing axis by up to 3°, but are not suitable for supporting swivel or wobble type motion.

The bearings are available with and without an inner ring.

Bearings without an inner ring are used if the shaft can be hardened and ground.

X-life®

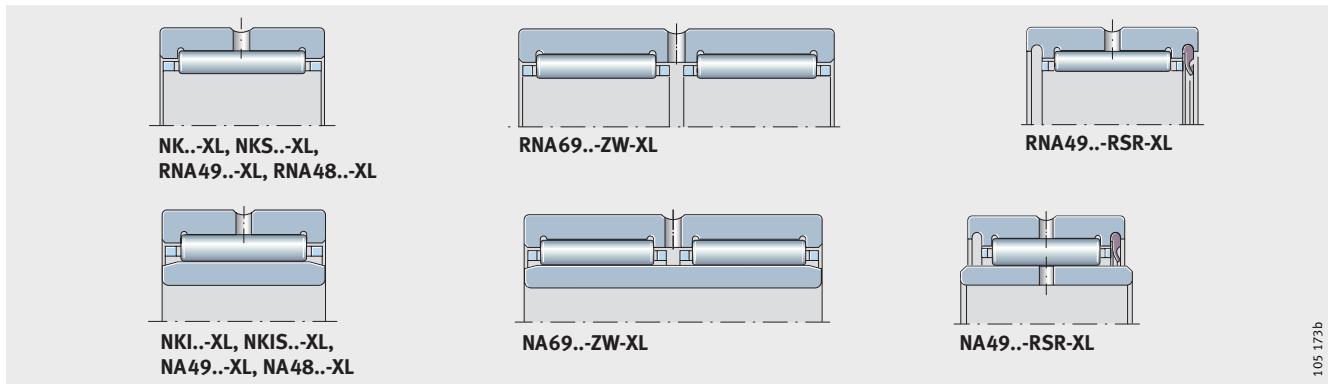

Combined needle roller bearings

44

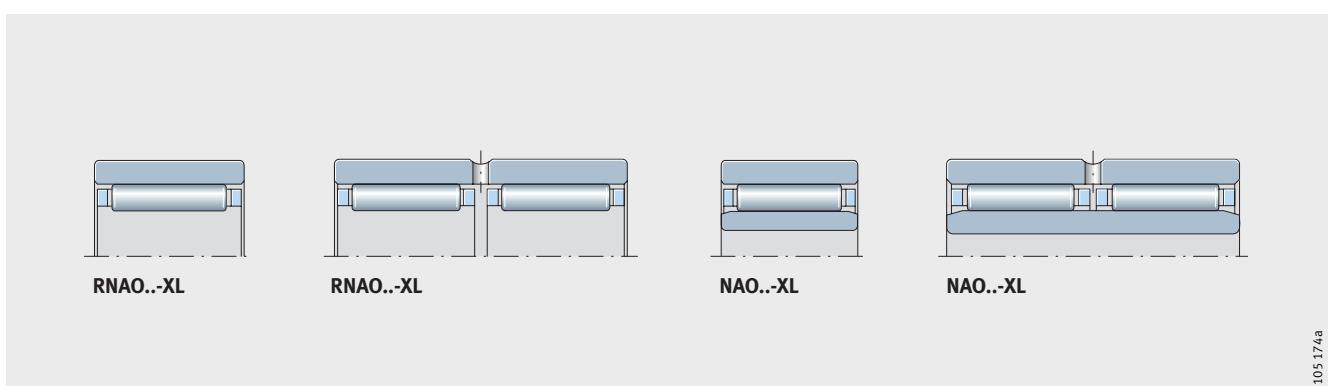

Combined needle roller bearings are radial bearings with an axial component capable of supporting loads. Combined needle roller bearings are used as semi-locating or locating bearings. They do not permit any skewing between the shaft and housing.

The bearings are available with and without an inner ring.

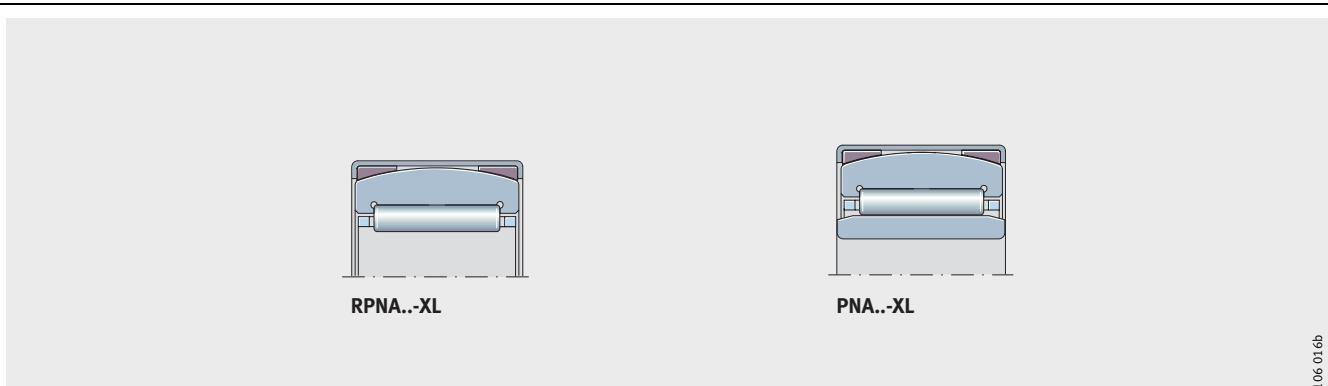

Bearings without an inner ring are used if the shaft can be hardened and ground.

Needle roller bearings with ribs

Features

Needle roller bearings are single or double row units comprising machined outer rings with ribs, needle roller and cage assemblies and removable inner rings.

Needle roller bearings without inner ring

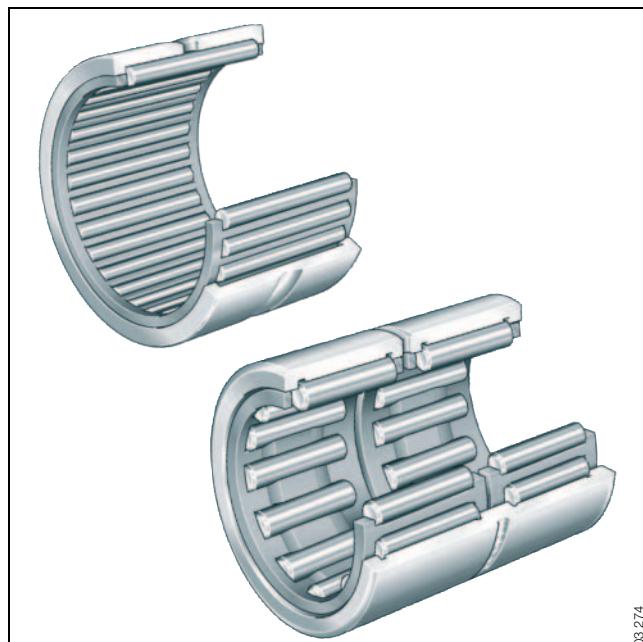

Bearings without inner rings have particularly compact radial dimensions. However, they require a shaft raceway that is hardened and ground. The bearings are available in open and sealed versions, *Figure 1* and *Figure 2*.

Bearings of type RNA69 are double row units if $F_w \geq 40$ mm.

Sealing/lubricant

Bearings of type RNA49..-RSR are fitted on one side and bearings of type RNA49..-2RSR on both sides with contact seals, *Figure 2*. They are greased with a lithium complex soap grease to DIN 51825-KP2N-20 and can be lubricated.

For lubrication, the bearings have a lubrication groove and lubrication hole in the outer ring, with the exception of: NK with $F_w \leq 10$ mm.

103 275

Figure 2 · Bearings with seals
RNA49..-RSR-XL, RNA49..-2RSR-XL

Needle roller bearings with inner ring

Needle roller bearings with inner ring are used if the shaft cannot be configured as a rolling bearing raceway. The bearings are available in open and sealed versions, *Figure 3* and *Figure 4*. Bearings of type NA69 are double row units if $d \geq 32$ mm.

Sealing/lubricant

Bearings of type NA49..-RSR are fitted on one side and bearings of type NA49..-2RSR on both sides with contact seals, *Figure 4*. They are greased with a lithium complex soap grease to DIN 51825–KP2N–20 and can be lubricated.

For lubrication, the bearings have a lubrication groove and lubrication hole in the outer ring, with the exception of: NKI with $d \leq 7$ mm.

Axial displacement of the inner ring

The standard inner ring allows axial displacement within the values "s" stated in the dimension tables. Where larger displacements occur, the standard ring can be replaced by a wider inner ring IR.

Needle roller bearings with ribs

Operating temperature

Unsealed bearings can be used at operating temperatures from -20°C to $+120^{\circ}\text{C}$.

 Sealed bearings are suitable for operating temperatures from -20°C to $+100^{\circ}\text{C}$; this is limited by the grease and seal material.

Cages

The cages made from sheet steel or plastic. Plastic cages have the suffix TN.

 Before using bearings with plastic cages, check the compatibility of the lubricant used with the cage material (PA66-GF/H).

Suffixes

Suffixes for the available designs: see table.

Available designs

Suffix	Description	Design
C3	Radial internal clearance larger than normal	Special design ¹⁾
P5	High dimensional and geometrical tolerances	Special design ¹⁾
RSR	Contact seal on one side	Standard
TN ²⁾	Cage made from glass fibre reinforced polyamide 66	Standard
XL	Bearings in X-life design	Standard
ZW ³⁾	Double row	Standard
2RSR	Contact seals on both sides	Standard

¹⁾ Available by agreement.

²⁾ Bearings with plastic cage: see dimension tables.

³⁾ Dependent on size.

Design and safety guidelines

Design of bearing arrangements for bearings with inner ring

Shaft and housing tolerances for bearings with inner ring: see "INA Catalogue 307".

Raceways for bearings without inner ring

In the case of bearings without an inner ring, the rolling element raceway on the shaft must be hardened and ground.

The surface hardness of the raceway must be $670 \text{ HV} + 170 \text{ HV}$ and the hardness depth Eht or Rht must be sufficiently large.

Raceway design

Shaft diameter Nominal dimension mm	Shaft tolerance			Roughness max.	Roundness max.	Parallelism max.
	over	incl.	Operating clearance			
over	incl.	Small	Normal	Large		
–	65	k5	h5	g6	$R_a 0,1$ ($R_z 0,4$)	25% of diameter tolerance
65	80	k5	h5	f6	$R_a 0,15$ ($R_z 0,63$)	
80	120	k5	g5	f6	$R_a 0,2$ ($R_z 1$)	
120	160	k5	g5	f6		
160	180	k5	g5	e6		
180	200	j5	g5	e6		
200	250	j5	f6	e6		
250	315	h5	f6	e6		
315	415	g5	f6	d6		

 The values apply to housing tolerances up to K7. For tighter housing bores, the operating clearance should be checked by either calculation or measurement.

Minimum radial load

In order to ensure operation without slippage, the bearings must be subjected to a minimum radial load $F_{r\min}$. This applies in particular to high speed bearings since, if the radial load is insufficient or not present, damaging sliding motion may occur between the rolling elements and raceways.

In continuous operation, therefore, a minimum radial load of magnitude $C_r/P < 50$ is necessary.

Speeds

The limiting speeds n_G for series RNA49..-RSR (2RSR) and NA49..-RSR (2RSR) are valid for grease lubrication.

Sealing rings/wider inner rings

Sealing rings of series G, GR and SD are matched to the bearing dimensions and can be combined with wider inner rings of series IR. The outer surface of the inner rings can be used as the sliding surface for seal lips.

Sealing rings: see "INA publication GSD".

Radial location

Needle roller bearings with inner ring are radially located by means of a close fit on the shaft and in the housing.

Axial location

In order to prevent lateral creep of the bearing rings, they must be located by means of physical locking, *Figure 5* and *Figure 6*.

The abutting shoulders (shaft, housing) should be sufficiently high and perpendicular to the bearing axis.

The transition from the bearing seat to the abutting shoulder should be designed with rounding to DIN 5418 or an undercut to DIN 509. The minimum values for the chamfer dimensions r as given in the dimension tables must be observed.

The overlap between the snap rings and the end faces of the bearing rings must be sufficiently large.

The maximum chamfer dimensions for the inner rings to DIN 620-6 must be taken into consideration.

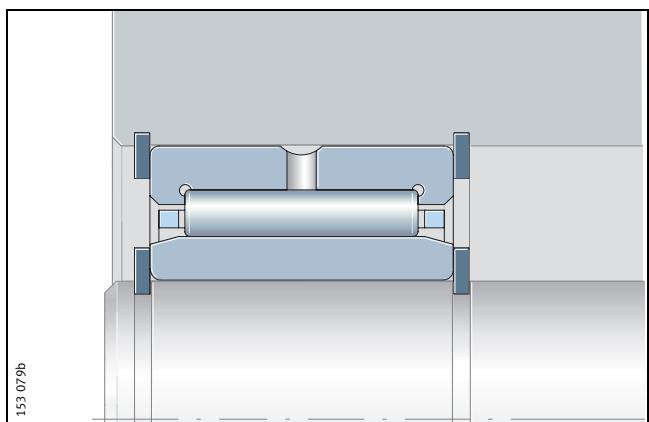

Figure 5 · Axial location by snap rings – NKI

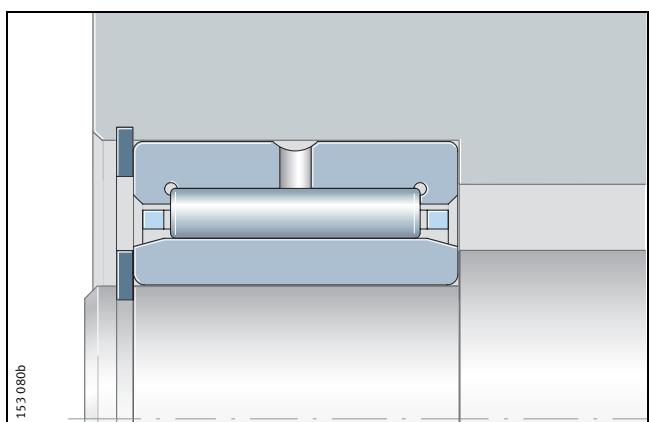

Figure 6 · Axial location by snap rings and abutting shoulders – NKI

Needle roller bearings with ribs

Accuracy

The dimensional and geometrical tolerances correspond to tolerance class PN to DIN 620.

Radial internal clearance

Bearings with inner ring have a radial internal clearance of CN, see table "Radial internal clearance".

Radial internal clearance to DIN 620-4

Bore d mm	incl.	Radial internal clearance			
		CN μm	C3 μm	min.	max.

400	450	210	310	310	410
450	500	220	330	330	440

Enveloping circle

For bearings without inner ring, the decisive factor is not the radial internal clearance but the enveloping circle diameter F_w .

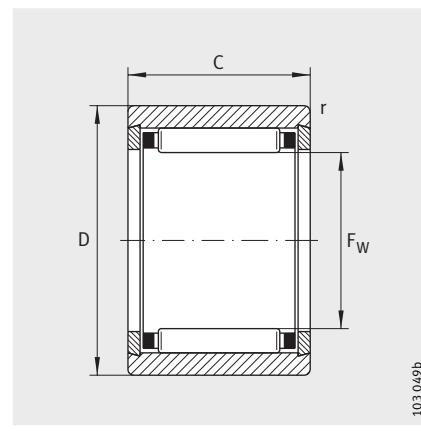

The enveloping circle is the inner inscribed circle of the needle rollers in clearance-free contact with the outer raceway.

For bearings before fitting, the enveloping circle F_w is in the tolerance zone F6.

Needle roller bearings without ribs

Features

Needle roller bearings are single or double row units comprising machined outer rings without ribs, needle roller and cage assemblies and removable inner rings.

The bearings are not self-retaining. This means that the outer ring, needle roller and cage assembly and inner ring can be fitted independently of each other.

Sealing/lubricant

Needle roller bearings without ribs are unsealed and are not supplied greased.

Double row bearings can be lubricated via a lubrication groove and lubrication hole in the outer ring.

Needle roller bearings without inner ring

Bearings of type RNAO have particularly compact radial dimensions, *Figure 1*. However, they require a shaft raceway that is hardened and ground.

The needle roller and cage assembly can be fitted either together with the outer ring or with the shaft. It can also be subsequently slid between the outer ring and shaft.

The double row design is indicated by the suffix ZW, the lubrication hole and lubrication groove are indicated by the suffix ASR1, *Figure 2*.

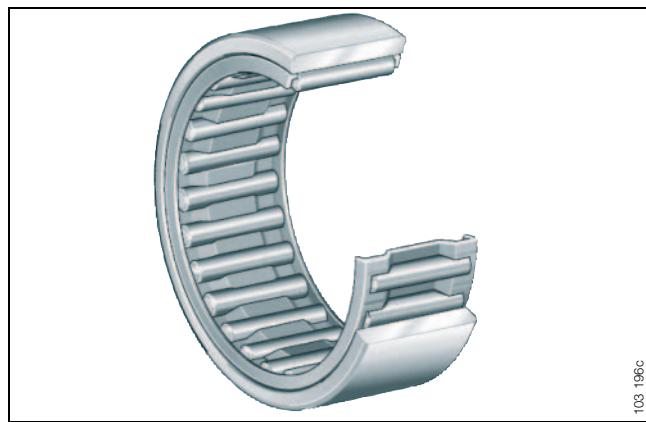

Figure 1 · Single row bearings
RNAO..-XL

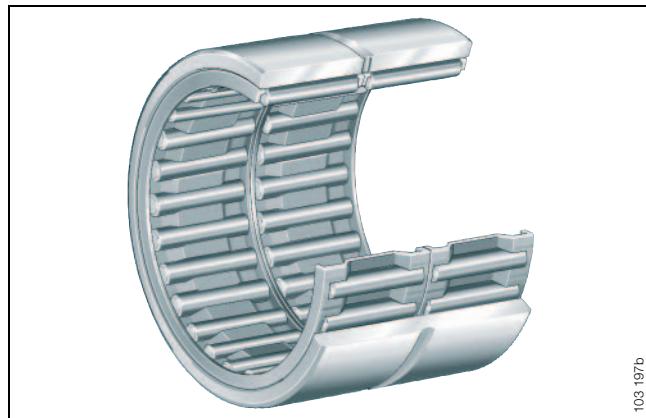

Figure 2 · Double row bearings
RNAO..-ZW-ASR1-XL

Needle roller bearings with inner ring

Bearings of type NAO are used if the shaft cannot be configured as a rolling bearing raceway, *Figure 3*.

The needle roller and cage assembly can be fitted either together with the outer ring or with the inner ring. It can also be subsequently slid between the outer ring and inner ring.

Bearings with a lubrication hole in the inner ring have the suffix IS1.

The double row design is indicated by the suffix ZW, the lubrication hole and lubrication groove are indicated by the suffix ASR1, *Figure 4*.

Axial displacement of the inner ring

The standard inner ring allows axial displacement within the values "s" stated in the dimension tables.

Where larger displacements occur, the standard ring can be replaced by a wider inner ring IR.

Needle roller bearings without ribs

Operating temperature

Bearings with plastic cage can be used at operating temperatures from -20°C to $+120^{\circ}\text{C}$.

Cages

The cages made from sheet steel or plastic.
Plastic cages have the suffix TN.

Suffixes

Suffixes for the available designs: see table.

Available designs

Suffix	Description
ASR1 ²⁾	Lubrication hole and lubrication groove in outer ring
CN	Normal radial internal clearance
IS1 ²⁾	Lubrication hole in inner ring
TN ¹⁾²⁾	Cage made from glass fibre reinforced polyamide 66
XL	Bearings in X-life design
ZW ²⁾	Double row

¹⁾ Bearings with plastic cage: see dimension tables.

²⁾ Dependent on size.

Design and safety guidelines

Design of bearing arrangements for bearings with inner ring

Shaft and housing tolerances for bearings with inner ring: see "INA Catalogue 307".

Raceways for bearings without inner ring

In the case of bearings without an inner ring, the rolling element raceway on the shaft must be hardened and ground.

The surface hardness of the raceway must be $670 \text{ HV} + 170 \text{ HV}$ and the hardness depth Eht or Rht must be sufficiently large.

Raceway design

Shaft diameter Nominal dimension mm	Shaft tolerance			Roughness max.	Roundness max.	Parallelism max.
	over	incl.	Small			
—	65	k5	h5	g6	$R_a 0,1$ ($R_z 0,4$)	25% of diameter tolerance
65	80	k5	h5	f6		
80	120	k5	g5	f6	$R_a 0,15$ ($R_z 0,63$)	50% of diameter tolerance

The values apply to housing tolerances up to K7.
For tighter housing bores, the operating clearance should be checked by either calculation or measurement.

Minimum radial load

In order to ensure operation without slippage, the bearings must be subjected to a minimum radial load $F_{r\min}$. This applies in particular to high speed bearings since, if the radial load is insufficient or not present, damaging sliding motion may occur between the rolling elements and raceways.

In continuous operation, therefore, a minimum radial load of magnitude $C_r/P < 50$ is necessary.

Sealing rings/wider inner rings

Sealing rings of series G, GR and SD are matched to the bearing dimensions and can be combined with wider inner rings of series IR. The outer surface of the inner rings can be used as the sliding surface for seal lips.

Sealing rings: see "INA publication GSD".

Sealing rings must not be used as running surfaces for the cage.

Axial guidance of needle roller and cage assemblies

In bearings without ribs, the needle roller and cage assemblies must be axially guided on lateral, burr-free running surfaces, see dimension tables.

 The axial running surfaces for the cage must be precision machined (R_a2) and resistant to wear. The mounting dimensions in the dimension tables must be taken into consideration.

Radial location

Needle roller bearings with inner ring are radially located by means of a close fit on the shaft and in the housing.

Axial location

In order to prevent lateral creep of the bearing rings, they must be located by means of physical locking.

The abutting shoulders (shaft, housing) should be sufficiently high and perpendicular to the bearing axis.

The transition from the bearing seat to the abutting shoulder should be designed with rounding to DIN 5 418 or an undercut to DIN 509. The minimum values for the chamfer dimensions r as given in the dimension tables must be observed.

The overlap between the snap rings and the end faces of the bearing rings must be sufficiently large.

The maximum chamfer dimensions for the inner rings to DIN 620-6 must be taken into consideration.

Accuracy

The dimensional and geometrical tolerances correspond to tolerance class PN to DIN 620.

Radial internal clearance

Bearings with inner ring have a radial internal clearance of CN, see table "Radial internal clearance".

Radial internal clearance to DIN 620-4

Bore d mm	incl.	Radial internal clearance	
		CN μm	
over		min.	max.
–	24	20	45
24	30	20	45
30	40	25	50
40	50	30	60
50	65	40	70
65	80	40	75
80	100	50	85
100	120	50	90

Enveloping circle

For bearings without inner ring, the decisive factor is not the radial internal clearance but the enveloping circle diameter F_w .

The enveloping circle is the inner inscribed circle of the needle rollers in clearance-free contact with the outer raceway.

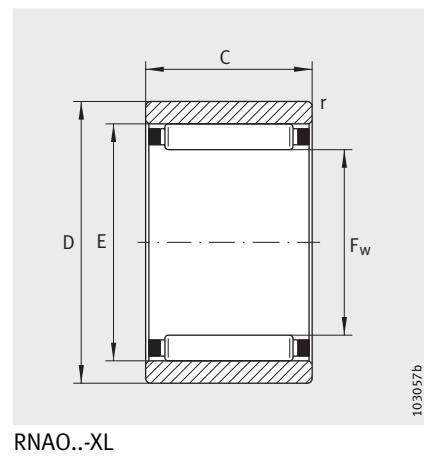

For bearings before fitting, the enveloping circle F_w is in the tolerance zone F6.

If an F6 tolerance zone is required for the enveloping circle diameter, the parts as delivered (outer ring/needle roller and cage assembly as a matched pair) must not be interchanged with other matched pairs.

Aligning needle roller bearings

Features

Aligning needle roller bearings are units comprising drawn outer cups, plastic support rings with a concave inner profile, outer rings with a spherical outside surface, needle roller and cage assemblies and removable inner rings.

The bearings can compensate static misalignments and can thus tolerate misalignment of the shaft relative to the housing; see "Compensation of misalignment", page 39.

Aligning needle roller bearings are firmly seated in the housing bore. The bore can therefore be produced easily and economically.

Sealing/lubricant

Aligning needle roller bearings without ribs are unsealed and are not supplied greased. They can be lubricated with grease or oil.

Needle roller bearings with/without inner ring

Bearings of type RPNA do not have an inner ring and are therefore particularly compact, *Figure 1*. However, they require a raceway that is hardened and ground.

Bearings of type PNA have an inner ring, *Figure 2*. They are used if the shaft cannot be configured as a rolling bearing raceway.

Displacement of the inner ring

The standard inner ring allows axial displacement within the values "s" stated in the dimension tables. Where larger displacements occur, the standard ring can be replaced by a wider inner ring IR.

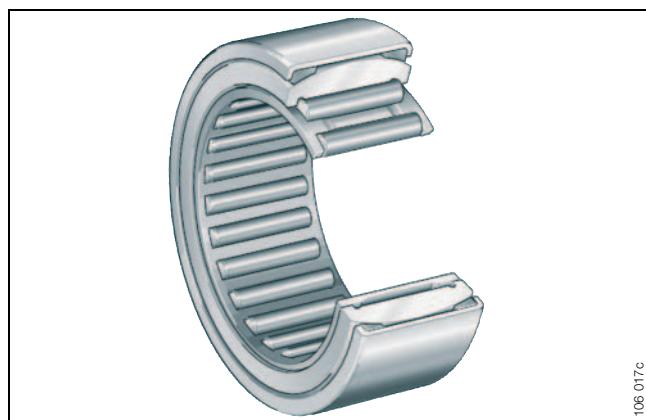

Figure 1 · Bearings without inner ring
RPNA..-XL

Figure 2 · Bearings with inner ring
PNA..-XL

Operating temperature

Aligning needle roller bearings are suitable for operating temperatures from -20°C to $+100^{\circ}\text{C}$, limited by the plastic support rings.

Cages

The bearings have sheet steel cages.

Design and safety guidelines

Compensation of misalignment

Due to the spherical outer ring and the concave support ring, aligning needle roller bearings can compensate static shaft misalignments of up to 3° .

The bearings must not be used to support swivel or wobble type motion. During adjustment motion between the outer cup and the ring, a breakaway torque occurs.

In order that adjustment motion can take place, the tolerances for the housing bore according to the table must be observed.

Design of bearing arrangements for bearings with inner ring

Shaft and housing tolerances for bearings with inner ring: see "INA Catalogue 307".

Raceways for bearings without inner ring

In the case of bearings without an inner ring, the rolling element raceway on the shaft must be hardened and ground.

The surface hardness of the raceway must be $670 \text{ HV} + 170 \text{ HV}$ and the hardness depth Eht or Rht must be sufficiently large.

Tolerances for the shaft raceway/housing bore

Housing material	Shaft tolerance for bearings without inner ring	Bore tolerance
Steel or cast iron	$h6$	N6
Light metal		R6

Tolerances for the shaft raceway/housing bore

Surface quality	Raceway for bearings without inner ring	Housing bore
Roughness max.	$R_a 0,1 (R_z 0,4)$	$R_a 0,8 (R_z 4)$
Roundness max.	25% of $h6$	IT 5/2
Parallelism max.	50% of $h6$	IT 5/2

Minimum radial load

In order to ensure operation without slippage, the bearings must be subjected to a minimum radial load $F_{r\min}$. This applies in particular to high speed bearings since, if the radial load is insufficient or not present, damaging sliding motion may occur between the rolling elements and raceways.

In continuous operation, therefore, a minimum radial load of magnitude $C_r/P < 50$ is necessary.

Speeds

The speeds n_G in the dimension tables are valid for oil lubrication.

With grease lubrication, the permissible value is taken as 60% of the value given in the table.

Aligning needle roller bearings

Radial and axial location

Aligning needle roller bearings are firmly seated in the housing bore. No further axial location is required.

Fitting by means of pressing mandrel

Due to the drawn outer cup, the bearings must be fitted using a special pressing mandrel: see the section "Drawn cup needle roller bearings" in "INA Catalogue 307".

The marked side of the bearing should be in contact with the flange of the mandrel. A toroidal ring on the mandrel holds the bearing securely on the mandrel.

Do not tilt the bearing while it is being pressed in.

Accuracy

Dimensional and geometrical tolerances are in accordance with tolerance class PN to DIN 620, apart from the outside diameter and width of the outer cup. The width has a tolerance of $\pm 0,5$ mm.

Radial internal clearance

Bearings with inner ring have a radial internal clearance of CN, see table "Radial internal clearance".

Radial internal clearance to DIN 620-4

Bore d mm		Radial internal clearance CN μm	
over	incl.	min.	max.
–	24	20	45
24	30	20	45
30	40	25	50
40	50	30	60

Enveloping circle

For bearings without inner ring, the decisive factor is not the radial internal clearance but the enveloping circle diameter F_w .

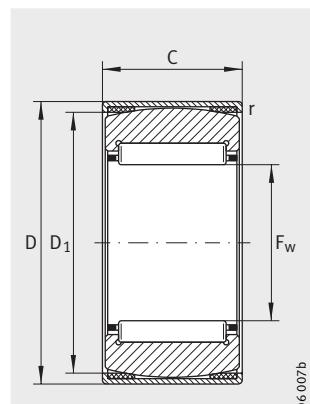

The enveloping circle is the inner inscribed circle of the needle rollers in clearance-free contact with the outer raceway.

The enveloping circle F_w before fitting is in the tolerance zone F6.

Combined needle roller bearings

Features

Combined needle roller bearings are units comprising radial needle roller bearings with a rolling bearing component capable of supporting axial loads.

The bearings can support high radial forces as well as axial forces in one direction, while bearings of type NKIB can support axial forces from both directions, and are used as locating or semi-locating bearings, *Figure 1*.

Needle roller/axial deep groove ball bearings

These bearings do not have an inner ring. Bearings without inner ring have particularly compact radial dimensions.

However, they require a shaft raceway that is hardened and ground, see page 48.

Bearings of type NX and NX..-Z have a full complement axial ball bearing component with end caps, *Figure 2*.

Bearings of type NKX (NAXK to DIN 5 429.1) and NKX..-Z (NAXK..-Z to DIN 5 429-1) have an axial bearing component comprising a ball and cage assembly with a sheet steel or plastic cage, *Figure 3*. Series NKX..-Z also has an end cap on the axial bearing component.

Sealing/lubricant

For lubrication, the bearings have a lubrication groove and lubrication hole in the outer ring.

Bearings of series NX and NKX are lubricated with oil.

The end cap in series NX has lubrication holes.

Bearings of series NX..-Z and NKX..-Z are lubricated with grease.

The axial bearing component is greased with a lithium complex soap grease to DIN 51 825–KP2N–20. The end caps do not have lubrication holes.

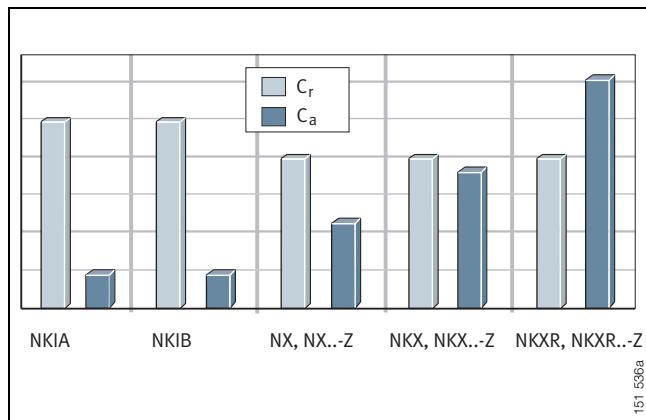

Figure 1 · Dynamic load carrying capacity C_r and C_a

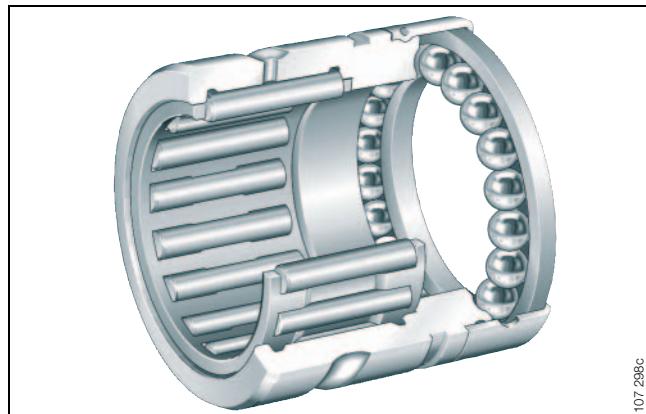

Figure 2 · Needle roller/axial deep groove ball bearings NX..-XL, NX..-Z-XL

Figure 3 · Needle roller/axial deep groove ball bearings NKX..-XL, NKX..-Z-XL

Needle roller/axial cylindrical roller bearings

Bearings of type NKXR (NAXR to DIN 5 429.1) and NKXR..Z (NAXR..Z to DIN 5 429.1) have an axial bearing component comprising a roller and cage assembly with a plastic cage; NKXR..Z also has an end cap on the axial bearing component, *Figure 4*.

These bearings do not have an inner ring. Bearings without inner ring have particularly compact radial dimensions. However, they require a shaft raceway that is hardened and ground, see page 48.

Sealing/lubricant

For lubrication, the bearings have a lubrication groove and lubrication hole in the outer ring.

Bearings of series NKXR are lubricated with oil.

Bearings of series NKXR..Z are lubricated with grease.

The axial bearing component is greased with a lithium complex soap grease to DIN 51825-KP2N-20. The end cap does not have lubrication holes.

Needle roller/angular contact ball bearings

Combined bearings of type NKIA and NKIB have an inner ring.

Series NKIA corresponds to DIN 5 429-2. It can support axial loads in one direction, *Figure 5*.

Series NKIB have one narrow and one wide inner ring, *Figure 6*.

The axial bearing component has a plastic ball cage. At the point where the inner rings join, there is a shoulder on both sides for guidance of the ball and cage assembly. As a result, these bearings are also suitable for supporting axial forces alternating in direction. The bearings guide the shaft with an axial clearance of 0,08 mm to 0,25 mm.

Sealing/lubricant

Bearings of type NKIA and NKIB can be lubricated with grease or oil.

For lubrication, the outer ring has a lubrication groove and a lubrication hole.

NKXR-XL, NKXR..Z-XL

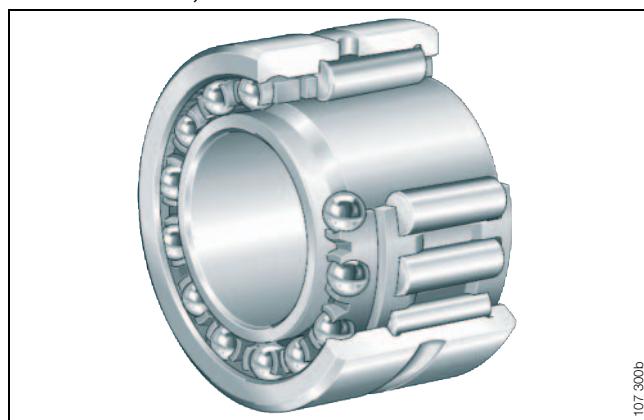

Figure 5 · Needle roller/angular contact ball bearings
NKIA..XL

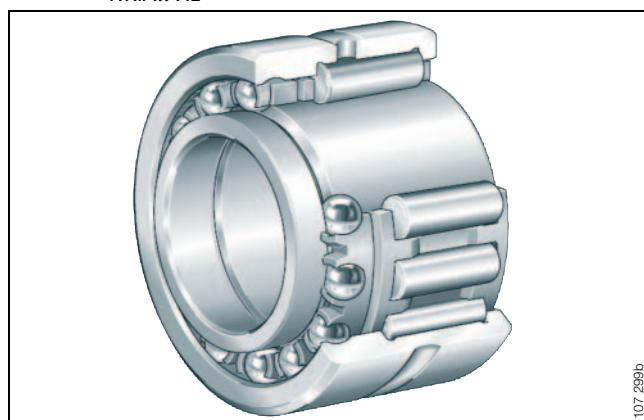

Figure 6 · Needle roller/angular contact ball bearings
NKIB..XL

Combined needle roller bearings

Operating temperature

The bearings can be used at operating temperatures from -20°C to $+120^{\circ}\text{C}$.

Cages

Bearings with plastic cage are indicated by the suffix TN in the dimension tables.

Suffixes

Suffixes for the available designs: see table.

Available designs

Suffix	Description
TN ¹⁾	Cage made from glass fibre reinforced polyamide 66
XL	Bearings in X-life design
Z	Bearing with end cap, axial bearing component greased with lithium complex soap grease to DIN 51825-KP2N-20

¹⁾ Bearings with plastic cage: see dimension tables.

Design and safety guidelines

Design of bearing arrangements for bearings with inner ring

Shaft and housing tolerances for bearings with inner ring: see "INA Catalogue 307".

Raceways for bearings without inner ring

In the case of bearings without an inner ring, the rolling element raceway on the shaft must be hardened and ground.

The surface hardness of the raceway must be 670 HV + 170 HV and the hardness depth Eht or Rht must be sufficiently large.

Tolerances for shaft raceway/housing bore

Series	Shaft tolerance		Bore tolerance
	Bearings without inner ring	Bearings with inner ring	
NKIA, NKIB	–	k6	M6
NX, NXX, NKXR	k6	k6	K6, M6 for rigid bearing arrangements

For bearings NKIA and NKIB, the shaft tolerance must not be greater than k6 and the bore tolerance must not be less than M6.

Surface for shaft raceway/housing bore

Surface quality	Shaft raceway		Housing bore
	Bearings without inner ring	Bearings with inner ring	
Roughness max.	R _a 0,1 (R _z 0,4)	–	–
Roundness max.	25% of k6	IT 4/2	IT 5/2
Parallelism max.	50% of k6	IT 4	IT 4

If the shaft cannot be configured as a raceway, inner rings of series IR or LR can be used. The inner rings must be ordered separately.

Support of axial forces

The axial bearing component must be preloaded to 1% of the axial basic static load rating C_{0a} . The basic load ratings C_{0a} are stated in the dimension tables.

Needle roller/axial deep groove ball bearings, needle roller/axial cylindrical roller bearings

In order to support axial forces, the bearing must be abutted by means of snap rings on the outer ring or a housing shoulder.

If there is little distance between the shaft centres, the snap rings should be shortened. Snap rings WR and SW are available from trade outlets.

If the bearings are to support axial forces from alternating directions, two bearings must be fitted opposed to each other. The unloaded bearing must be axially preloaded, for example by means of springs. This allows compensation of thermal expansion.

In order to avoid double fits on NKX and NKXR bearings, the axial bearing component should be free in the housing (outside diameter D_1 or $D_2 + 0,5$ mm min.).

Needle roller/angular contact ball bearings

Bearings of type NKIA can support axial forces in one direction, bearings of type NKIB can support axial forces in both directions.

If bearings of type NKIA are to support axial forces from alternating directions, two bearings must be fitted opposed to each other, *Figure 7*.

In the case of bearing type NKIB, the wide and narrow inner ring must be axially clamped against each other. The narrow inner ring has a larger bore diameter. This results in an interference fit if a shaft tolerance of $k6$ is used. The bearings guide the shaft with an axial clearance of between 0,08 mm and 0,25 mm.

Axial static load safety factor

The axial static load safety factor S_0 must be $> 1,5$.

 The axial load must not exceed $1/4$ of the radial load.

Minimum radial load

In order to ensure operation without slippage, the bearings must be subjected to a minimum radial load $F_{r\min}$. This applies in particular to high speed bearings since, if the radial load is insufficient or not present, damaging sliding motion may occur between the rolling elements and raceways.

In continuous operation, therefore, a minimum radial load of magnitude $C_r/P < 50$ is necessary.

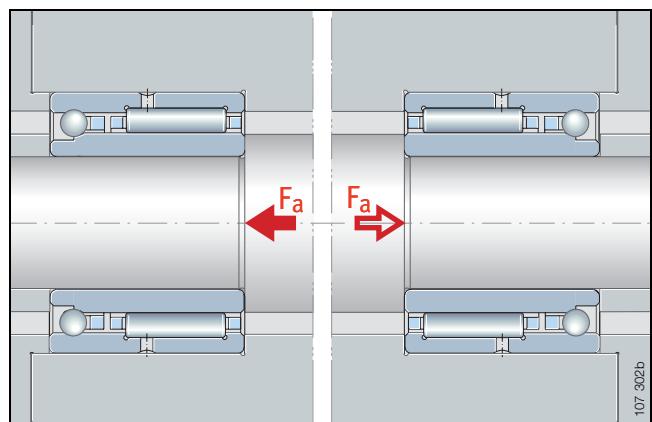

Figure 7 · NKIA..-XL, two bearings in opposed arrangement

Combined needle roller bearings

Speeds

The speeds n_G in the dimension tables are valid for oil lubrication.

 With grease lubrication, the permissible value is taken as 60% of the value given in the table.

Für bearings of type NKXR, NKXR..Z, NKIA, NKIB, the reference speed n_G is stated in the dimension tables. In order to calculate the thermally safe speed n_{per} , NKXR(Z) must be regarded as an axial bearing and NKIA, NKIB must be regarded as radial bearings.

Radial location

Combined needle roller bearings with inner ring are radially located by means of a close fit on the shaft and in the housing.

Axial location

In order to prevent lateral creep of the bearing rings, they must be located by means of physical locking.

The abutting shoulders (shaft, housing) should be sufficiently high and perpendicular to the bearing axis.

The transition from the bearing seat to the abutting shoulder should be designed with rounding to DIN 5418 or an undercut to DIN 509. The minimum values for the chamfer dimensions r as given in the dimension tables must be observed.

The overlap between the snap rings and the end faces of the bearing rings must be sufficiently large.

The maximum chamfer dimensions for the inner rings to DIN 620-6 must be taken into consideration.

Lubrication

Before operation, the radial component should be greased using a grease of similar quality to that used in the axial component.

In order to determine the relubrication interval, values must be calculated separately for the axial and radial component and the lower value should be used.

Accuracy

The dimensional and geometrical tolerances correspond to tolerance class PN to DIN 620. This excludes bearings of type NKIB in relation to the bore d_1 of the narrow inner ring and the width (-0,3 mm) over both inner rings and bearings of type NKX and NKXR in relation to the diameters D_1, D_2 .

Radial internal clearance

Bearings with inner ring have a radial internal clearance of CN, see table "Radial internal clearance".

Radial internal clearance to DIN 620-4

Bore d mm		Radial internal clearance CN μm	
over	incl.	min.	max.
-	24	20	45
24	30	20	45
30	40	25	50
40	50	30	60
50	65	40	70
65	80	40	75
80	100	50	85

Enveloping circle

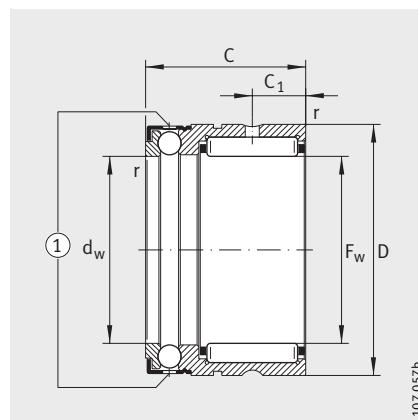

For bearings without inner ring, the decisive factor is not the radial internal clearance but the enveloping circle diameter F_w . The enveloping circle is the inner inscribed circle of the needle rollers in clearance-free contact with the outer raceway.

For bearings before fitting, the enveloping circle F_w is in the tolerance zone F6.

1) Diameter d_1 deviates from DIN 620.
The narrow inner ring has a larger bore diameter. This results in an interference fit if a shaft tolerance of k6 is used.
