Large-Size Rolling Bearings

CAT. No. E125f

Introduction to NSK Large-Size Rolling Bearing Catalog (CAT. No. E125f)

We want to thank you for your interest in this edition of our Large-Size Rolling Bearing Catalog.

Recently, operating requirements for machines and other equipment that use rolling bearings have become increasingly severe and diversified. Accordingly, rolling bearings, which are highly important machine elements, must be designed to satisfy more and more stringent requirements for higher speeds, greater precision, higher reliability, and other challenging demands.

We edited this Large-Size Rolling Bearing Catalog to reflect the growing number of NSK products, new developments, and technical progress. In it, you will find a wide range of bearings that will satisfy almost any requirement; however, special bearings not listed here are available by contacting NSK.

The first part (A pages) contains general information about rolling bearings to facilitate selection of the most appropriate type. Next, supplementary technical information is provided peculiar to each bearing type at the beginning of the section devoted to each type (B pages). Also, there is an explanation about special-purpose bearings, mostly for steel mill roll necks.

In the dimensional tables, bearings are listed in the order of increasing bore size. The data shown for each bearing includes the boundary dimensions, bearing load ratings, abutment and fillet dimensions, and mass.

At the end, NSK products and certain applications specially designed to meet particular conditions are shown. These may be helpful regarding bearing selection and the design of surrounding parts.

Data in this catalog are given in both the International Unit System (SI) and Engineering Unit System (Gravitational System of Units).

We hope this catalog will allow you to select the optimum bearing for your application. However, if assistance is required, please contact NSK, and the company's engineers and computer programs can quickly supply the information you need.

1. SELECTION OF BEARING SIZE

1.1 Bearing Life

The various functions required of rolling bearings vary according to the bearing application. These functions must be performed for a prolonged period. Even if bearings are properly mounted and correctly operated, they will eventually fail to perform satisfactorily due to an increase in noise and vibration, loss of running accuracy, deterioration of grease, or fatigue flaking of the rolling surfaces. Bearing life, in the broad sense of the term, is the period during which bearings continue to operate and to satisfy their required functions. This bearing life may be defined as noise life, abrasion life, grease life, or rolling fatigue life, depending on which one causes loss of bearing service.

Aside from the failure of bearings to function due to natural deterioration, bearings may fail when conditions such as heat-seizure, fracture, scoring of the rings, wear of the seals, or other damage occurs.

Conditions such as these should not be interpreted as normal bearing failure since they often occur as a result of errors in bearing selection, improper design or manufacture of the bearing surroundings, incorrect mounting, or insufficient maintenance.

1.1.1 Rolling Fatigue Life and Rating Fatigue Life

When rolling bearings are operated under load, the raceways of their inner and outer rings and rolling elements are subjected to repeated cyclic stress. Because of metal fatigue of the rolling contact surfaces of the raceways and rolling elements, scaly particles may separate from the bearing material. This phenomenon is called "flaking". Rolling fatigue life is represented by the total number of revolutions at which time the bearing surface will start flaking due to stress. This is called fatigue life. Even for seemingly identical bearings, which are of the same type, size, and material and receive the same heat treatment and other processing, the rolling fatigue life varies greatly even under identical operating conditions. This is because the flaking of materials due to fatigue is subject to many other variables. Consequently, "rating fatigue life", in which rolling fatigue life is treated as a statistical phenomenon, is used in preference to actual rolling fatigue life.

Suppose a number of bearings of the same type are operated individually under the same conditions. After a certain period of time, 10% of them fail as a result of flaking caused by rolling fatigue. In this case, the total number of revolutions is defined as the rating fatigue life or, if the speed is constant, the rating fatigue life is often expressed by the total number of operating hours completed when 10% of the bearings become inoperable due to flaking.

1.2 Basic Dynamic Load Rating and Fatigue Life

1.2.1 Basic Dynamic Load Rating

The basic dynamic load rating is defined as the constant load applied on bearings with stationary outer rings that the inner rings can endure for a rating life of one million revolutions (10^6 rev). The basic dynamic load rating of radial bearings is defined as a central radial load of constant direction and magnitude, while the basic dynamic load rating of thrust bearings is defined as an axial load of constant magnitude in the same direction as the central axis. The load ratings are listed under C_r for radial bearings and C_a for thrust bearings in the dimension tables.

1.2.2 Selection of Bearing Size Based on Basic Dynamic Load Rating

The following relation exists between bearing load and rating fatigue life:

$$\text{For ball bearings} \quad L = \left(\frac{C}{P} \right)^3 \quad (1.1)$$

$$\text{For roller bearings} \quad L = \left(\frac{C}{P} \right)^{\frac{10}{3}} \quad (1.2)$$

where L : Rating fatigue life (10^6 rev)
 P : Bearing load (equivalent load) (N), {kgf}
 C : Basic dynamic load rating (N), {kgf}
 For radial bearings, C is written C_r
 For thrust bearings, C is written C_a

In the case of bearings that run at a constant speed, it is convenient to express the fatigue life in terms of hours. In general, the fatigue life of bearings used in automobiles and other vehicles is given in terms of mileage.

By designating the rating fatigue life as L_h (h), bearing speed as n (rpm), fatigue life factor as f_h , and speed factor as f_n , the relations shown in Table 1.1 are obtained:

Table 1.1 Rating Fatigue Life, Fatigue Life Factor and Speed Factor

Life Parameters	Ball Bearings	Roller Bearings
Rating Fatigue Life	$L_h = \frac{10^6}{60n} \left(\frac{C}{P} \right)^3 = 500f_h^3$	$L_h = \frac{10^6}{60n} \left(\frac{C}{P} \right)^{\frac{10}{3}} = 500f_h^{\frac{10}{3}}$
Fatigue Life Factor	$f_h = f_n \frac{C}{P}$	$f_h = f_n \frac{C}{P}$
Speed Factor	$f_n = \left(\frac{10^6}{500 \times 60n} \right)^{\frac{1}{3}} = (0.03n)^{-\frac{1}{3}}$	$f_n = \left(\frac{10^6}{500 \times 60n} \right)^{\frac{3}{10}} = (0.03n)^{-\frac{3}{10}}$

n, f_n Fig. 1.1, Appendix Table 12 (See Page C50)

L_h, f_h Fig. 1.2, Appendix Table 13 (See Page C51)

Fig. 1.1 Bearing Speed and Speed Factor

Fig. 1.2 Fatigue Life Factor and Fatigue Life

If the bearing load P and speed n are known, determine a fatigue life factor f_h appropriate for the projected life of the machine and then calculate the basic dynamic load rating C by means of the following equation.

$$C = \frac{f_h \cdot P}{f_n} \quad \text{(1.3)}$$

A bearing which satisfies this value of C should then be selected from the bearing tables.

1.2.3 Temperature Adjustment for Basic Dynamic Load Rating

If rolling bearings are used at high temperature, the hardness of the bearing steel decreases. Consequently, the basic dynamic load rating, which depends on the physical properties of the material, also decreases. Therefore, the basic dynamic load rating should be adjusted for the higher temperature using the following equation:

$$C_t = f_t \cdot C \quad \text{(1.4)}$$

where C_t : Basic dynamic load rating after temperature adjustment (N), {kgf}
 f_t : Temperature factor
(See Table 1.2.)
 C : Basic dynamic load rating before temperature adjustment (N), {kgf}

If large bearings are used at high temperatures, they must be given special dimensional stability heat treatment to prevent excessive dimensional changes. The basic dynamic load rating of bearings given such special dimensional stability heat treatment may become lower than the basic dynamic load rating listed in the bearing tables.

Table 1.2 Temperature Factor f_t

Bearing Temperature °C	125	150	175	200	250
Temperature Factor f_t	1.00	1.00	0.95	0.90	0.75

1.2.4 Adjustment of Rating Fatigue Life

As described previously, the basic equations for calculating the rating fatigue life are as follows:

$$\text{For ball bearings} \quad L_{10} = \left(\frac{C}{P} \right)^3 \quad \text{(1.5)}$$

$$\text{For roller bearings} \quad L_{10} = \left(\frac{C}{P} \right)^{\frac{10}{3}} \quad \text{(1.6)}$$

The L_{10} life is defined as the rating fatigue life with a statistical reliability of 90%. Depending on the machines in which the bearings are used, sometimes a reliability higher than 90% may be required.

However, recent improvements in bearing material have greatly extended the fatigue life. In addition, the development of the Elasto-Hydrodynamic Theory of Lubrication proves that the thickness of the lubricating film in the contact zone between rings and rolling elements greatly influences bearing life. To reflect such improvements in the calculation of fatigue life, the rating fatigue life is adjusted using the following adjustment factors:

$$L_{na} = a_1 a_2 a_3 L_{10} \quad \text{(1.7)}$$

where L_{na} : Adjusted rating life in which reliability, material improvements, lubricating condition, etc. are considered

L_{10} : Rating fatigue life with a reliability of 90%

a_1 : Life adjustment factor for reliability

a_2 : Life adjustment factor for special bearing property

a_3 : Life adjustment factor for operating conditions

The life adjustment factor for reliability a_1 is listed in Table 1.3 for reliabilities higher than 90%.

The life adjustment factor for special bearing property a_2 is greater than one because of improvements in bearing steel.

NSK now uses vacuum degassed bearing steel, and the results of tests by NSK show that life is greatly improved when compared with earlier materials. The basic dynamic load ratings C_r and C_a listed in the bearing tables were calculated considering the extended life achieved by improvements in materials and manufacturing techniques. Consequently, when estimating life using Equation (1.7), it is sufficient to assume $a_2=1$.

The life adjustment factor for operating conditions a_3 is used to adjust for various factors, particularly lubrication. If there is no misalignment between the inner and outer rings and the thickness of the lubricating film in the contact zones of the bearing is sufficient, it is possible for a_3 to be greater than one; however, a_3 is less than one in the following cases:

- When the viscosity of the lubricant in the contact zones between the raceways and rolling elements is low.
- When the circumferential speed of the rolling elements is very slow.
- When the bearing temperature is high.
- When the lubricant is contaminated by water or foreign particles.
- When misalignment of the inner and outer rings is excessive.

It is difficult to determine the proper value for a_3 for specific operating conditions because there are still many unknowns. Since the special bearing property factor a_2 is also influenced by the operating conditions, there is a proposal to combine a_2 and a_3 into one quantity ($a_2 \times a_3$), and not consider them independently. In this case, under normal lubricating and operating conditions, the product ($a_2 \times a_3$) should be assumed equal to one. However, if the viscosity of the lubricant is too low, the value drops to as low as 0.2.

If there is no misalignment and a lubricant with high viscosity is used so sufficient fluid-film thickness is secured, the product of ($a_2 \times a_3$) may be about two.

When selecting a bearing based on the basic dynamic load rating, it is best to choose a reliability factor a_1 appropriate for the projected use and an empirically determined C/P or f_t value derived from past results for lubrication, temperature, mounting conditions, etc. in similar machines.

The rating fatigue life equations (1.1), (1.2), (1.5), and (1.6) give satisfactory results for a broad range of bearing loads. However, extra heavy loads may cause detrimental plastic deformation at ball/raceway contact points. When P_r exceeds C_r (Basic static load rating) or 0.5 C_r , whichever is smaller, for radial bearings or P_a exceeds 0.5 C_a for thrust bearings, please consult NSK to establish the applicability of the rating fatigue life equations.

Table 1.3 Reliability Factor a_1

Reliability (%)	90	95	96	97	98	99
a_1	1.00	0.62	0.53	0.44	0.33	0.21

1.3 Calculation of Bearing Loads

The loads applied on bearings generally include the weight of the body to be supported by the bearings, the weight of the revolving elements themselves, the transmission power of gears and belting, the load produced by the operation of the machine in which the bearings are used, etc. These loads can be theoretically calculated, but some of them are difficult to estimate. Therefore, it becomes necessary to correct the estimates using empirically derived data.

1.3.1 Load Factor

When a radial or axial load has been mathematically calculated, the actual load on the bearing may be greater than the calculated load because of vibration and shock present during operation of the machine. The actual load may be calculated using the following equation:

$$\left. \begin{aligned} F_r &= f_w \cdot F_{rc} \\ F_a &= f_w \cdot F_{ac} \end{aligned} \right\} \quad (1.8)$$

where F_r, F_a : Loads applied on bearing (N), {kgf}

F_{rc}, F_{ac} : Theoretically calculated load (N), {kgf}

f_w : Load factor

The values given in Table 1.4 are usually used for the load factor f_w .

Table 1.4 Values of Load Factor f_w

Operating Conditions	Typical Applications	f_w
Smooth operation free from shock	Electric motors, Machine tools, Air conditioners	1 to 1.2
Normal operation	Air blowers, Compressors, Elevators, Cranes, Paper making machines	1.2 to 1.5
Operation accompanied by shock and vibration	Construction equipment, Crushers, Vibrating screens, Rolling mills	1.5 to 3

1.3.2 Average of Fluctuating Load

When the load applied on bearings fluctuates, an average load which will yield the same bearing life as the fluctuating load should be calculated.

(1) When the relation between load and rotating speed is divided into the following steps (Fig. 1.3).

Load F_1 : Speed n_1 ; Operating time t_1

Load F_2 : Speed n_2 ; Operating time t_2

⋮

Load F_n : Speed n_n ; Operating time t_n

Then, the average load F_m may be calculated using the following equation:

$$F_m = \frac{p}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n} \sqrt{F_1^p n_1 t_1 + F_2^p n_2 t_2 + \dots + F_n^p n_n t_n} \quad (1.9)$$

where F_m : Average fluctuating load (N), {kgf}

$p=3$ for ball bearings

$p=10/3$ for roller bearings

The average speed n_m may be calculated as follows:

$$n_m = \frac{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}{t_1 + t_2 + \dots + t_n} \quad (1.10)$$

Fig. 1.3 Incremental Load Variation

(2) When the load fluctuates almost linearly (Fig. 1.4), the average load may be calculated as follows:

$$F_m = \frac{1}{3} (F_{min} + 2F_{max}) \quad (1.11)$$

where F_{min} : Minimum value of fluctuating load (N), {kgf}

F_{max} : Maximum value of fluctuating load (N), {kgf}

(3) When the load fluctuation is similar to a sine wave (Fig. 1.5), an approximate value for the average load F_m may be calculated from the following equation:

In the case of Fig. 1.5(a)

$$F_m \doteq 0.65 F_{max} \quad (1.12)$$

In the case of Fig. 1.5(b)

$$F_m \doteq 0.75 F_{max} \quad (1.13)$$

Fig. 1.4 Simple Load Fluctuation

The values of X and Y are listed in the bearing tables. The equivalent radial load for radial roller bearings with $\alpha=0^\circ$ is

$$P=F_r$$

In general, thrust ball bearings cannot take radial loads, but spherical thrust roller bearings can take some radial loads. In this case, the dynamic equivalent load may be calculated using the following equation:

$$P=F_a+1.2F_r \quad (1.15)$$

where $\frac{F_r}{F_a} \leq 0.55$

1.5 Basic Static Load Ratings and Static Equivalent Loads

1.5.1 Basic Static Load Ratings

When subjected to an excessive load or a strong shock load, rolling bearings may incur a local permanent deformation of the rolling elements and raceway surface if the elastic limit is exceeded. The nonelastic deformation increases in area and depth as the load increases, and when the load exceeds a certain limit, the smooth running of the bearing is impeded.

The basic static load rating is defined as that static load which produces the following calculated contact stress at the center of the contact area between the rolling element subjected to the maximum stress and the raceway surface.

$$\text{For ball bearings} \quad 4200 \text{ MPa} \\ \{428 \text{ kgf/mm}^2\}$$

$$\text{For roller bearings} \quad 4000 \text{ MPa} \\ \{408 \text{ kgf/mm}^2\}$$

In this most heavily stressed contact area, the sum of the permanent deformation of the rolling element and that of the raceway is nearly 0.0001 times the rolling element's diameter. The basic static load rating C_0 is written C_{0r} for radial bearings and C_{0a} for thrust bearings in the bearing tables.

In addition, following the modification of the criteria for basic static load rating by ISO, the new C_0 values for NSK's ball bearings became about 0.8 to 1.3 times the past values and those for roller bearings about 1.5 to 1.9 times. Consequently, the values of permissible static load factor f_s have also changed, so please pay attention to this.

1.5.2 Static Equivalent Loads

The static equivalent load is a hypothetical load that produces a contact stress equal to the above maximum stress under actual conditions, while the bearing is stationary (including very slow rotation or oscillation), in the area of contact between the most heavily stressed rolling element and bearing raceway. The static radial load passing through the bearing center is taken as the static equivalent load for radial bearings, while the static axial load in the direction coinciding with the central axis is taken as the static equivalent load for thrust bearings.

(a) Static equivalent load on radial bearings

The greater of the two values calculated from the following equations should be adopted as the static equivalent load on radial bearings.

$$P_0 = X_0 F_r + Y_0 F_a \dots \dots \dots (1.16)$$

$$P_0 = F_r \dots \dots \dots (1.17)$$

where

P_0 : Static equivalent load (N), {kgf}

F_r : Radial load (N), {kgf}

F_a : Axial load (N), {kgf}

X_0 : Static radial load factor

Y_0 : Static axial load factor

(b) Static equivalent load on thrust bearings

$$P_0 = X_0 F_r + F_a \quad \alpha \neq 90^\circ \dots \dots \dots (1.18)$$

where P_0 : Static equivalent load (N), {kgf}

α : Contact angle

When $F_a < X_0 F_r$, this equation becomes less accurate.

The values of X_0 and Y_0 for Equations (1.16) and (1.18) are listed in the bearing tables.

The static equivalent load for thrust roller bearings with $\alpha=90^\circ$ is

$$P_0 = F_a$$

1.5.3 Permissible Static Load Factor

The permissible static equivalent load on bearings varies depending on the basic static load rating and also their application and operating conditions.

The permissible static load factor f_s is a safety factor that is applied to the basic static load rating, and it is defined by the ratio in Equation (1.19). The generally recommended values of f_s are listed in Table 1.5. Conforming to the modification of the static load rating, the values of f_s were revised, especially for bearings for which the values of C_0 were increased, please keep this in mind when selecting bearings.

$$f_s = \frac{C_0}{P_0} \dots \dots \dots (1.19)$$

where C_0 : Basic static load rating (N), {kgf}

P_0 : Static equivalent load (N), {kgf}

For spherical thrust roller bearings, the value of f_s should be greater than 4.

Table 1.5 Values of Permissible Static Load Factor f_s

Operating Conditions	Lower Limit of f_s	
	Ball Bearings	Roller Bearings
Low-noise applications	2	3
Bearings subjected to vibration and shock loads	1.5	2
Standard operating conditions	1	1.5

2. BEARING TOLERANCES

2.1 Bearing Tolerance Standards

The tolerances for the boundary dimensions and running accuracy of rolling bearings are specified by ISO 492/199/582 (Accuracies of Rolling Bearings). Tolerances are specified for the following items:

Table 2.1 Bearing Types and Tolerance Classes

Bearing Types		Applicable Tolerance Classes				Applicable Tables	Reference Pages	
Deep Groove Ball Bearings	Normal	Class 6	Class 5	Class 4	—	Table 2.2	A16 to A19

0	-2 000	—	—	—	—	—	—	140	—	—	—

Notes ⁽¹⁾ Applicable to bearings with cylindrical bores.

⁽²⁾ Tolerance for width deviation and tolerance limits for the width variation of the outer ring should be the same bearing.

Tolerances for the width variation of the outer ring of Classes 5 and 4, are shown in Table 2.2.2.

⁽³⁾ Applicable to individual rings manufactured for combined bearings.

⁽⁴⁾ Applicable to ball bearings such as deep groove ball bearings, angular contact ball bearings, etc.

Remarks 1. The cylindrical bore diameter "no-go side" tolerance limit (high) specified in this table does not necessarily apply within a distance of 1.2 times the chamfer dimension r (max.) from the ring face.
 2. ANSI/ABMA Std 20-1996 : ABEC1 • RBEC1, ABEC3 • RBEC3, ABEC5 • RBEC5, and ABEC7 • RBEC7 are equivalent to Classes Normal, 6, 5, and 4 respectively.

2 000	2 500	0	-250	—	—	—	—	—	—

Notes ⁽¹⁾ Applicable only when a locating snap ring is not used.

⁽²⁾ Applicable to ball bearings such as deep groove ball bearings and angular contact ball bearings.

⁽³⁾ The tolerances for outer ring width variation of bearings of Classes Normal and 6 are shown in Table 2.2.1.

Remarks

- The outside diameter "no-go side" tolerances (low) specified in this table do not necessarily apply within a distance of 1.2 times the chamfer dimension *r* (max.) from the ring face.
- ANSI/ABMA Std 20-1996 : ABEC1 • RBEC1, ABEC3 • RBEC3, ABEC5 • RBEC5, and ABEC7 • RBEC7 are equivalent to Classes Normal, 6, 5, and 4 respectively.

Remarks The effective width of an inner ring with rollers T_1 is defined as the overall bearing width of an inner ring with rollers combined with a master outer ring.

The effective width of an outer ring T_2 is defined as the overall bearing width of an outer ring combined with a master inner ring with rollers.

Remarks

1. The bore diameter "no-go side" tolerances (high) specified in this table do not necessarily apply within a distance of 1.2 times the chamfer dimension *r* (max.) from the washer face.
2. Some of these tolerances conform to the NSK Standard.
3. Please consult with NSK for tolerances of bore diameter over 500mm.

Notes (1) V_{dp} ; Bore diameter variation in a single radial plane.

(2) Not apply to (K30) 1:30.

Remarks Please consult with NSK for tolerances of bore diameters over 500mm.

3. FITS AND INTERNAL CLEARANCES

3.1 Fits

3.1.1 Importance of Proper Fits

In the case of a rolling bearing with the inner ring fitted to the shaft with only slight interference, a harmful circumferential slipping may occur between the inner ring and shaft. This slipping of the inner ring, which is called "creep", results in a circumferential displacement of the ring relative to the shaft if the interference fit is not sufficiently tight.

When creep occurs, the fitted surfaces become abraded, causing wear and considerable damage to the shaft. Abnormal heating and vibration may also occur due to abrasive metallic particles entering the interior of the bearing.

It is important to prevent creep by having sufficient interference to firmly secure that ring which rotates to either the shaft or housing. Creep cannot always be eliminated using only axial tightening through the bearing ring faces. Generally, it is not necessary, however, to provide interference for rings subjected only to stationary loads. Fits are sometimes made without any interference for either the inner or outer ring, to accommodate certain operating conditions, or to facilitate mounting and dismounting. In this case, to prevent damage to the fitting surfaces due to creep, lubrication or other applicable methods should be considered.

3.1.2 Selection of Fit

(1) Load Conditions and Fit

The proper fit may be selected from Table 3.1 based on the load and operating conditions.

(2) Magnitude of Load and Interference

The interference of the inner ring is slightly reduced by the bearing load; therefore, the loss of interference should be estimated using the following equations:

$$\left. \begin{aligned} \Delta d_F &= 0.08 \sqrt{\frac{d}{B}} F_r \times 10^{-3} \text{(N)} \\ \Delta d_F &= 0.25 \sqrt{\frac{d}{B}} F_r \times 10^{-3} \text{(kgf)} \end{aligned} \right\} \quad (3.1)$$

where Δd_F : Interference decrease of inner ring (mm)

d : Bearing bore diameter (mm)

B : Nominal inner ring width (mm)

F_r : Radial load applied on bearing (N), (kgf)

Table 3. 1 Loading Conditions and Fits

Load Application	Bearing Operation		Load Conditions	Fitting	
	Inner Ring	Outer Ring		Inner Ring	Outer Ring
	Rotating	Stationary	Rotating Inner Ring Load Stationary Outer Ring Load	Tight Fit	Loose Fit
	Stationary	Rotating			
	Stationary	Rotating	Rotating Outer Ring Load Stationary Inner Ring Load	Loose Fit	Tight Fit
	Rotating	Stationary			

Direction of load indeterminate due to variation of direction or unbalanced load

Table 3. 4 Fits of Radial Bearings with Housings

Load Conditions		Examples	Tolerances for Housing Bores	Axial Displacement of Outer Ring	Remarks
Solid Housings	Rotating Outer Ring Loads	Heavy Loads on Bearing in Thin-Walled Housing Heavy Shock Loads	P7	Impssible	—
		Normal or Heavy Loads	N7		
		Light or Variable Loads	M7		
	Direction of Load Indeterminate	Heavy Shock Loads	Traction Motors	Generally Impossible	If axial displacement of the outer ring is not required.
		Normal or Heavy Loads	K7		
		Normal or Light Loads	JS7 (J7)		
Solid of Split Housings	Rotating Inner Ring Loads	Loads of All kinds	H7	Easy Displacement	—
		Normal or Light Loads	H8		
		High Temperature Rise of Inner Ring Through Shaft	G7		
	Direction of Load Indeterminate	Accurate Running Desirable under Normal and Light Loads	JS6 (J6)	Possible	—
		High Speed Centrifugal Compessor Free Bearings	K6		
Solid Housings	Rotating Inner Ring Loads	Accurate Running and High Rigidity Desirable under Variable Loads	M6 or N6	Impossible	For heavy loads, interference fit tighter than K is used. When high accuracy is required, very strict tolerances should be used for fitting.

Remarks This table is applicable to cast iron and steel housings. For housings made of light alloy, the interference should be tighter than those in this table.

Table 3. 5 Fits of Thrust Bearings with Housings

Load Conditions		Bearing Types	Tolerances for Housing Bores	Remarks
Axial Loads Only	Thrust Ball Bearings Cylindrical Roller Thrust Bearings	Clearance over 0.25mm	For General Applications	
		H8	When precision is required	
	Spherical Thrust Roller Bearings Steep Angle Tapered Roller Bearings	Outer ring has radial clearance.	When radial loads are sustained by other bearings.	
Combined Radial and Axial Loads	Stationary Outer Ring Loads	H7 or JS7 (J7)	—	
	Rotating Outer Ring Loads of Direction of Load Indeterminate	Spherical Thrust Roller Bearings	K7	Normal Loads
			M7	Relatively Heavy Radial Loads

Notes ⁽¹⁾ For bearing with D greater than 304.8 mm, Class 0 does not exist.

3.2 Bearing Internal Clearances**3.2.1 Internal Clearances and Their Standards**

The internal clearance in rolling bearings in operation greatly influences bearing performance including fatigue life, vibration, noise, heat-generation, etc.

Consequently, the selection of the proper internal clearance is one of the most important tasks when choosing a bearing after the type and size have been determined.

This bearing internal clearance is the combined clearances between the inner/outer rings and rolling elements. The radial and axial clearances are defined as the total amount that one ring can be displaced relative to the other in the radial and axial directions respectively (Fig. 3.1).

To obtain accurate measurements, the clearance is generally measured by applying a specified measuring load on the bearing; therefore, the measured clearance (sometimes called "measured clearance" to make a distinction) is always slightly larger than the theoretical internal clearance (called "geometrical clearance" for radial bearings) by the amount of elastic deformation caused by the measuring load.

Therefore, the theoretical internal clearance may be obtained by correcting the measured clearance by the amount of elastic deformation. However, in the case of roller bearings this elastic deformation is negligibly small.

Usually the clearance before mounting is the one specified as the theoretical internal clearance.

In Table 3.8, reference table and page numbers are listed by bearing types.

Table 3. 8 Index for Radial Internal Clearances by Bearing Types

Bearing Types	Table Number	Page Number	
Deep Groove Ball Bearings	3.9	A40	
Deep Groove Ball Bearings	3.10.1	A40	
	3.10.2	A40	
Cylindrical Roller Bearings	With Cylindrical Bores (Interchangeable)		
	With Cylindrical Bores (Matched)	3.11	A41
	With Tapered Bores (Matched)		
Spherical Roller Bearings	With Cylindrical Bores	3.12	A42
	With Tapered Bores		
Double-Row and Combined Tapered Roller Bearings	3.13	A43	
Combined Angular Contact Ball Bearings ⁽¹⁾	3.14	A44	

Notes ⁽¹⁾ Values given are axial clearances.

Remarks This table is applicable to bearings in Tolerance Classes N and 6. For internal axial clearances in bearings in tolerance classes better than 5 and contact angles of 15° and 25°, it is advisable to consult NSK.

3.2.2 Selection of Bearing Internal Clearances

Among the bearing internal clearances listed in the tables, the CN Clearance is adequate for standard operating conditions. The clearance becomes progressively smaller from C2 to C1 and larger from C3 to C5 in that order. Standard operating conditions are defined as those where the inner ring speed is less than normal the load is less than normal ($P \leq 0.1C_r$), and the bearing is tight-fitted on the shaft.

Since the internal clearance varies with the fit and temperature differences in operation, the change in radial clearance in a roller bearing is shown in Fig. 3.2 as an example.

(1) Decrease in Radial Clearance Caused by Fitting and Residual Clearance

When the inner ring or the outer ring is tight-fitted on a shaft or in a housing, a decrease in the radial internal clearance is caused by the expansion or contraction of the bearing rings. The decrease varies according to the bearing type and size and design of the shaft and housing. The amount of this decrease is approximately 70 to 90% of the interference. The internal clearance after subtracting this decrease from the theoretical internal clearance Δ_0 is called the residual clearance, Δ_f .

(2) Decrease in Radial Internal Clearance Caused by Temperature Difference between Inner and Outer Rings and Effective Clearance

The frictional heat generated during operation is conducted away through the shaft and housing. Since housings generally conduct heat better than shafts, the temperature of the inner ring and the rolling elements is usually higher than that of the outer ring by 5 to 10°C. If the shaft is heated or the housing is cooled, the difference in temperature between the inner and outer rings is greater. The radial clearance decreases due to the thermal expansion caused by the temperature difference between the inner and outer rings. The amount of this decrease can be calculated using the following equations:

$$\delta_t = \alpha \Delta_t D_e \quad (3.6)$$

where δ_t : Decrease in radial clearance due to temperature difference between inner and outer rings (mm)

α : Coefficient of linear expansion of bearing steel $\approx 12.5 \times 10^{-6}$ (1/°C)

Δ_t : Temperature difference between inner and outer rings (°C)

D_e : Outer ring raceway diameter (mm)

For ball bearings

$$D_e = \frac{1}{5} (4D + d) \quad (3.7)$$

For roller bearings

$$D_e = \frac{1}{4} (3D + d) \quad (3.8)$$

The clearance after subtracting this δ_t from the residual clearance, Δ_f is called the effective clearance, Δ . Theoretically, the longest life of a bearing can be expected when the effective clearance is slightly negative. However, it is difficult to achieve such an ideal condition, and an excessive negative clearance will greatly shorten the bearing life.

Therefore, a clearance of zero or a slightly positive amount, instead of a negative one, should be selected. When single-row angular contact ball bearings or tapered roller bearings are used facing each other, there should be a small effective clearance, unless a preload is required.

When two cylindrical roller bearings with a rib on one side are used facing each other, it is necessary to provide adequate axial clearance to allow for shaft elongation during operation.

The radial clearances used in some specific applications are given in Table 3.15.

Under special operating conditions, it is advisable to consult NSK.

Fig. 3.2 Change in Radial Internal Clearance of Bearings

Table 3. 15 Examples of Clearances for Specific Applications

Operating Conditions	Examples	Internal Clearance
When steam passes through hollow shafts or roller shafts are heated.	Dryers in paper making machines Table rollers for rolling mills	C3, C4 C3
When impact loads and vibration are severe or when both the inner and outer rings are tight-fitted.	Traction motors for railways Vibrating screens Fluid couplings Final reduction gears for tractors	C4 C3, C4 C4 C4
When clearance is adjusted after mounting to prevent shaft deflection, etc.	Main shafts of lathes	CC9, CC1

4. LUBRICATION

4.1 Purposes of Lubrication

The main purposes of lubrication are to reduce friction and wear inside the bearings that may cause premature failure. The effects of lubrication may be briefly explained as follows:

(1) Reduction of Friction and Wear

Direct metallic contact between the bearing rings, rolling elements and cage, which are the basic components of a bearing, is prevented by an oil film which reduces the friction and wear in the contact areas.

(2) Extension of Fatigue Life

The rolling fatigue life of bearings depends greatly upon the viscosity and film thickness between the rolling contact surfaces. A heavy film thickness prolongs the fatigue life, but it is shortened if the viscosity of the oil is too low so the film thickness is insufficient.

(3) Dissipation of Frictional Heat and Cooling

Circulation lubrication may be used to carry away frictional heat or heat transferred from the outside to prevent the bearing from overheating and the oil from deteriorating.

(4) Others

Adequate lubrication also helps to prevent foreign material from entering the bearings and guards against corrosion or rusting.

4.2 Lubricating Methods

The various lubricating methods are first divided into either grease or oil lubrication. Satisfactory bearing performance can be achieved by adopting the lubricating method which is most suitable for the particular application and operating condition.

In general, oil offers superior lubrication; however grease lubrication allows a simpler structure around the bearings. A comparison of grease and oil lubrication is given in Table 4.1.

Table 4. 1 Comparison of Grease and Oil Lubrication

Item	Grease Lubrication	Oil Lubrication
Housing Structure and Sealing Method	Simple	May be complex. Careful maintenance required.
Speed	Limiting speed is 65% to 80% of that with oil lubrication.	High limiting speed.
Cooling Effect	Poor	Heat transfer is possible using forced oil circulation.
Fluidity	Poor	Good
Full Lubricant Replacement	Sometimes difficult	Easy
Removal of Foreign Matter	Removal of particles from grease is impossible.	Easy
External Contamination due to Leakage	Surroundings seldom contaminated by leakage.	Often leaks without proper countermeasures. Not suitable if external contamination must be avoided.

4.2.1 Grease Lubrication

(1) Grease Quantity

The quantity of grease to be packed in a housing depends on the housing design and free space, grease characteristics, and ambient temperature.

Sufficient grease must be packed inside the bearing including the cage guide face. The available space inside the housing to be packed with grease depends on the speed as follows:

Table 4. 2 Packed Grease Amount

Speed	Grease volume Internal space	Remarks
Low	2/3 to 1	To prevent particles and water from entering
Normal	1/2 to 2/3	
High	1/3 to 1/2	The higher the speed, the less the grease.

(2) Replacement of Grease

Grease, once packed, usually need not be replenished for a long time; however, for severe operating conditions, grease should be frequently replenished or replaced. In such cases, the bearing housing should be designed to facilitate grease replenishment and replacement.

When replenishment intervals are short, provide replenishment and discharge ports at appropriate positions so deteriorated grease is replaced by fresh grease. For example, the housing space on the grease supply side can be divided into several sections with partitions. The grease on the partitioned side gradually passes through the bearings and old grease forced from the bearing is discharged through a grease valve (Fig. 4.1). If a grease valve is not used, the space on the discharge side is made larger than the partitioned side so it can retain the old grease, which is removed periodically by removing the cover.

Fig. 4.1 Combination of Partitioned Grease Reservoir and Grease Valve

(1) Radial Ball Bearings, Cylindrical Roller Bearings

(3) Replenishing Interval

Even if high-quality grease is used, there is deterioration of its properties with time; therefore, periodic replenishment is required. Figs 4.2 (1) and (2) show the replenishment time intervals for various bearing types running at different speeds. These figures apply only if the temperature of the bearings is less than 70°C; the replenishment time interval must be reduced by half for every 15°C temperature rise of the bearings.

(2) Tapered Roller Bearings, Spherical Roller Bearings

Fig. 4.2 Grease Replenishment Intervals

4.2.2 Oil Lubrication

(1) Oil Bath Lubrication

Oil bath lubrication is a widely used method in the case of low or medium speeds. The oil level should be at the center of the lowest rolling element. It is desirable to provide a sight gauge so the proper oil level may be maintained (Fig. 4.3).

(2) Drip Feed Lubrication

Drip feed lubrication is widely used for small ball bearings operated at relatively high speeds. As shown in Fig. 4.4, oil is stored in a visible oiler. The oil drip rate is controlled with the screw in the top.

(3) Splash Lubrication

With this lubricating method, oil is splashed onto the bearings by gears or a simple rotating disc installed near bearings without submerging the bearings in oil. It is commonly used in various gear boxes. Fig. 4.5 shows this lubricating method used on a reduction gear.

Fig. 4.3 Oil Bath Lubrication

Fig. 4.4 Drip Feed Lubrication

Fig. 4.5 Splash Lubrication

Fig. 4.6 Circulating Lubrication

(4) Circulating Lubrication

Circulating lubrication is commonly used for high speed operation requiring bearing cooling and for bearings used at high temperatures. As shown in Fig. 4.6 (a), oil is supplied by the pipe on the right side, it travels through the bearing, and drains out through the pipe on the left. After being cooled in a reservoir, it returns to the bearing through a pump and filter. The oil discharge pipe should be larger than the supply pipe so an excessive amount of oil will not back up in the housing.

(5) Jet Lubrication

Jet lubrication is often used for ultra high speed bearings, such as the bearings in jet engines with a $d_m n$ value (d_m : pitch diameter of rolling element set in mm; n : rotational speed in min^{-1}) exceeding one million. Lubricating oil is sprayed under pressure from one or more nozzles directly into the bearing.

Fig. 4.7 shows an example of ordinary jet lubrication. In the case of high speed operation, the air surrounding the bearing rotates with it causing the oil jet to be deflected. The jetting speed of the oil from the nozzle should be more than 20% of the circumferential speed of the inner ring outer surface. More uniform cooling and a better temperature distribution is achieved using more nozzles for a given amount of oil. Therefore, it is desirable for the oil to be forcibly discharged so the agitating resistance of the lubricant can be reduced and the oil can effectively carry away the heat.

(6) Oil Mist Lubrication

Oil mist lubrication, also called oil fog lubrication, utilizes an oil mist sprayed into a bearing. This method has the following advantages:

- Because of the small quantity of oil required, the oil agitation resistance is small, and higher speeds are possible.
- Contamination of the vicinity around the bearing is slight because the oil leakage is small.
- It is relatively easy to continuously supply fresh oil; therefore, the bearing life is extended.

Fig. 4.7 Jet Lubrication

This lubricating method is used in bearings for high speed pumps, roll necks of rolling mills, etc (Fig. 4.8). For oil mist lubrication of large bearings, it is advisable to consult NSK.

(7) Oil-Air Lubricating Method

Using the oil-air lubricating method, a very small amount of oil is discharged intermittently by a constant-quantity piston into a pipe carrying a constant flow of compressed air. The oil flows along the wall of the pipe and approaches a constant flow rate.

The major advantages of oil-air lubrication are:

- Since the minimum necessary amount of oil is supplied, this method is suitable for high speeds because less heat is generated.
- Since the minimum amount of oil is fed continuously, bearing temperature remains stable. Also, because of the small amount of oil, there is almost no atmospheric pollution.
- Since only fresh oil is fed to the bearings, oil deterioration need not be considered.
- Since compressed air is always fed to the bearings, the internal pressure is high, so dust, cutting fluid, etc. cannot enter.

Fig. 4.8 Oil Mist Lubrication

Fig. 4.9 Oil-Air Lubrication

4.3 Lubricants

4.3.1. Lubricating Grease

Grease is a semi-solid lubricant consisting of a base oil and a thickener. The main types and general properties of grease are shown in Table 4.3. It should be remembered that different brands of same type of grease may have different properties.

(1) Base Oil

Mineral oils or synthetic oils such as silicone or diester oil are mainly used as the base oil for grease. The lubricating properties of grease depend mainly on the characteristics of its base oil. Therefore, the viscosity of the base oil is just as important when selecting grease as when selecting an oil. Usually, grease made with low viscosity base oils are more suitable for high speeds and low temperatures, while greases made with high viscosity base oil are more suited for high temperatures and heavy loads. However, the thickener also influences the lubricating properties of grease; therefore, the selection criteria for grease is not the same as for lubricating oil.

(2) Thickener

As thickeners for lubricating grease, there are several types of metallic soaps, inorganic thickeners such as silica gel and bentonite, and heat resisting organic thickeners such as polyurea and fluoric compounds. The type of thickener is closely related to the grease dropping point (¹⁾; generally, grease with high dropping point also has a high temperature capability during operation. However, this type of grease does not have a high working temperature unless the base oil is heat resistant. The highest possible working temperature for grease should be determined considering the heat resistance of the base oil, etc. The water resistance of grease depends upon the type of thickener. Sodium soap grease or compound grease containing sodium soap emulsifies when exposed to water or high humidity, and therefore, cannot be used where moisture is prevalent.

(3) Additives

Grease often contains various additives such as antioxidants, corrosion inhibitors, and extreme pressure additives to give it special properties. It is recommended that extreme pressure additives be used in heavy load applications. For long use without replenishment, an antioxidant should be added.

Note ⁽¹⁾ The grease dropping point is that temperature at which a grease heated in a specified small container becomes sufficiently fluid to drip.

Table 4. 3				
Lithium Grease		Li Soap		
Name (Popular name)	Thickener			
Properties	Base Oil	Mineral Oil	Diester Oil, Polyatomic Ester Oil	Silicone Oil
Dropping Point, °C	170 to 195	170 to 195	200 to 210	
Working Temperatures, °C	-20 to +110	-50 to +130	-50 to +160	
Speed capability	Good	Excellent	Good	
Mechanical Stability	Good	Good	Good	
Pressure Resistance	Fair	Fair	Poor	
Water Resistance	Good	Good	Good	
Rust Prevention	Good	Good	Poor	
Remarks	General purpose grease used for numerous applications	Good low temperature and torque characteristics	Mainly for high temperature applications. Unsuitable for bearings for high speeds or heavy loads or those having numerous sliding-contact areas (roller bearings, etc.)	

(4) Consistency

Consistency indicates the "softness" of grease. Table 4.4 shows the relation between consistency and working conditions.

(5) Mixing Different Types of Grease

In general, different brands of grease must not be mixed. Mixing grease with different types of thickeners may destroy its composition and physical properties. Even if the thickeners are of the same type, possible differences in the additive may cause detrimental effects.

Grease Properties

Sodium Grease (Fiber Grease)	Calcium Grease (Cup Grease)	Mixed Base Grease	Complex Base Grease (Complex Grease)	Non-Soap Base Grease (Non-Soap Grease)
Na Soap	Ca Soap	Na+Ca Soap, Li+Ca Soap, etc.	Ca Complex Soap, Al Complex Soap, Li Complex Soap, etc.	Urea, Bentonite, Carbon Black, Fluoric Compounds, Heat Resistant Organic Compound, etc.
Mineral Oil	Mineral Oil	Mineral Oil	Mineral Oil	Mineral Oil
170 to 210	70 to 90	160 to 190	180 to 300	> 230
-20 to +130	-20 to +60	-20 to +80	-20 to +130	-10 to +130
Good	Fair	Good	Good	Fair to Excellent
Good	Poor	Good	Good	Good
Fair	Poor	Fair to Good	Fair to Good	Fair
Poor	Good	Poor for Na Soap Grease	Good	Good
Poor to Good	Good	Fair to Good	Fair to Good	Fair to Good
Long and short fiber types are available. Long fiber grease is unsuitable for high speeds. Attention to water and high temperature is required.	Extreme pressure grease containing high viscosity mineral oil and extreme pressure additive (Pb soap, etc.) has high pressure resistance.	Often used for roller bearings and large ball bearings.	Suitable for extreme pressures mechanically stable	Mineral oil base grease is general purpose lubricant. Synthetic oil base grease is recommended for special environments with very high temperatures, acids, alkalis, radioactivity, and exposure to flames.

Remarks The grease properties shown here can vary between brands.

Table 4. 4 Consistency and Working Conditions

Consistency Number	0	1	2	3	4
Consistency ⁽¹⁾ 1/10 mm	355 to 385	310 to 340	265 to 295	220 to 250	175 to 205
Working Conditions (Application)	<ul style="list-style-type: none"> For centralized oiling When fretting is likely to occur 	<ul style="list-style-type: none"> For centralized oiling When fretting is likely to occur For low temperatures 	<ul style="list-style-type: none"> For general use For sealed ball bearings 	<ul style="list-style-type: none"> For general use For sealed ball bearings For high temperatures 	<ul style="list-style-type: none"> For high temperatures For grease seals

Notes ⁽¹⁾ Consistency: Depth into grease attained by a cone when pressed with a specified weight, indicated in units of 1/10mm. The larger the value, the softer the grease.

4.3.2 Lubricating Oil

The lubricating oils used for rolling bearings are usually highly refined mineral oil or synthetic oil that have a high oil film strength and superior oxidation and corrosion resistance. When selecting a lubricating oil, the viscosity at the operating conditions is important. If the viscosity is too low, a proper oil film is not formed and abnormal wear and seizure may occur. On the other hand, if the viscosity is too high, excessive viscous resistance may cause heating or large power loss. In general, low viscosity oils should be used at high speed; however, the viscosity should increase with increasing bearing load and size. Table 4.5 gives generally recommended viscosities for bearings under normal operating conditions.

For use when selecting the proper lubricating oil, Fig. 4.10 shows the relationship between oil temperature and viscosity, and examples of selection are shown in Table 4.6.

Table 4.5 Bearing Types and Proper Viscosity of Lubricating Oils

Bearing Type	Proper Viscosity at Operating Temperature
Ball Bearings and Cylindrical Roller Bearings	Higher than 13 mm ² /s
Tapered Roller Bearings and Spherical Roller Bearings	Higher than 20 mm ² /s
Spherical Thrust Roller Bearings	Higher than 32 mm ² /s

Remarks 1mm²/s=1cSt (centistoke)

Fig. 4.10 Temperature-Viscosity Chart

Oil Replacement Intervals

Oil replacement intervals depend on the operating conditions and oil quantity.

In those cases where the operating temperature is less than 50°C, and the environmental conditions are good with little dust, the oil should be replaced approximately once a year. However, in cases where the oil temperature is about 100°C, the oil must be changed at least once every three months.

If moisture may enter or if foreign matter may be mixed in the oil, then the oil replacement interval must be shortened. Mixing different brands of oil must be prevented for the same reason given previously for grease.

Table 4.6 Examples of Selection of Lubricating Oils

Operating Temperature	Speed	Light or Average Load	Heavy or Shock Load
-30 to 0°C	Low, Normal	ISO VG 15, 22, 32 (refrigerating machine oil)	—
0 to 50°C	Low	ISO VG 32, 46, 68 (bearing oil, turbine oil)	ISO VG 46, 68, 100 (bearing oil, turbine oil)
	Normal to High	ISO VG 15, 22, 32 (bearing oil, turbine oil)	ISO VG 22, 32, 46 (bearing oil, turbine oil)
	High	ISO VG 10, 15, 22 (bearing oil)	—
50 to 80°C	Low	ISO VG 100, 150, 220 (bearing oil)	ISO VG 150, 220, 320 (bearing oil)
	Normal to High	ISO VG 46, 68, 100 (bearing oil, turbine oil)	ISO VG 68, 100, 150 (bearing oil, turbine oil)
	High	ISO VG 32, 46, 68 (bearing oil, turbine oil)	—
80 to 110°C	Low	ISO VG 320, 460 (bearing oil)	ISO VG 460, 680 (bearing oil, gear oil)
	Normal to High	ISO VG 150, 220 (bearing oil)	ISO VG 220, 320 (bearing oil)
	High	ISO VG 68, 100 (bearing oil, turbine oil)	—

Remarks

- 1. Refer to Refrigerating Machine Oils (JIS K 2211), Bearing Oils (JIS K 2239), Turbine Oils (JIS K 2213), Gear Oils (JIS K 2219).
- 2. If the operating temperature is near the high end of the temperature range listed in the left column, select a high viscosity oil.
- 3. If the operating temperature is lower than -30°C or higher than 110°C, it is advisable to consult NSK.

5. BEARING MATERIALS

The bearing rings and rolling elements of rolling bearings are subjected to repetitive high pressure with a small amount of sliding. The cages are subjected to tension and compression and sliding contact with the rolling elements and either or both of the bearing rings.

Therefore, the materials used for the rings, rolling elements, and cages require the following characteristics:

Other necessary characteristics, such as easy production, shock and heat resistance, and corrosion resistance, are required depending on individual applications.

5.1 Materials for Bearing Rings and Rolling Elements

Primarily, high carbon chromium bearing steel (Table 5.1) is used for the bearing rings and rolling elements. Most NSK bearings are made of SUJ2 among the JIS steel types listed in Table 5.1, while the larger bearings generally use SUJ3. The chemical composition of SUJ2 is approximately the same as AISI 52100 specified in the USA, DIN 100 Cr6 in West Germany, and BS 535A99 in England.

For bearings that are subjected to very severe shock loads, carburized low-carbon alloy steels such as chrome steel, chrome molybdenum steel, nickel chrome molybdenum steel, etc. are often used. Such steels, when they are carburized to the proper depth and have sufficient surface hardness, are more shock resistant than normal, through-hardened bearing steels because of the softer energy-absorbing core. The chemical composition of common carburized bearing steels is listed in Table 5.2.

NSK uses highly pure vacuum-degassed bearing steel containing a minimum of oxygen, nitrogen, and hydrogen compound impurities. The rolling fatigue life of bearings has been remarkably improved using these materials combined with the appropriate heat treatment.

For special purpose bearings, high temperature bearing steel, which has superior heat resistance, and stainless steel having good corrosion resistance may be used. The chemical composition of these special materials are given in Tables 5.3 and 5.4.

5.2 Cage Materials

The low carbon steel shown in Table 5.5 are the main ones for the pressed cages for bearings. Depending on the purpose, brass or stainless steel may be used. For machined cages, high strength brass (Table 5.6) or carbon steel (Table 5.5) is used. Sometimes synthetic resin is also used.

Table 5.1 Chemical Composition of High-Carbon Chromium Bearing Steel (Major Elements)

Standard	Symbols	Chemical Composition (%)						
		C	Si	Mn	P	S	Cr	Mo

SINGLE-ROW DEEP GROOVE BALL BEARINGS

Single-Row Deep Groove Ball Bearings

Bore Diameter 90 – 1100mm B6

Design, Types, and Features

Single-row deep groove ball bearings are the most common type of rolling bearings. Their range of application is very wide. The raceway grooves in both the inner and outer rings have circular arcs of slightly larger radius than that of the balls. In addition to radial loads, axial loads can be imposed in either direction. Because of their low torque, they are highly suitable for applications where high speeds and low power loss are required.

For deep groove ball bearings, pressed cages are usually used. For large bearings and high speed applications, machined brass cages are used.

Standard types of deep groove ball bearings are as follows:

Figure 1
Pressed cage

Figure 2
Machined cage

Figure 3
Beveled inner ring

Regarding the deep groove ball bearings used with four-row cylindrical roller bearings for roll necks, refer to Page B412.

Tolerances and Running Accuracy Table 2.2 (Pages A16 to A19)

Recommended Fits Table 3.2 (Page A35)
Table 3.4 (Page A36)

Internal Clearances Table 3.9 (Page A40)

Permissible Misalignment

The permissible misalignment of single-row deep groove ball bearings varies depending on their size, internal clearance during operation, bearing loads, etc. In general, it is approximately 0.0006 to 0.003 radian (2' to 10').

Precautions for Use of Deep Groove Ball Bearings

For deep groove ball bearings, if the bearing load is too small during operation, slippage occurs between the balls and raceways, which may result in smearing. The higher the weight of balls and cage, the higher this tendency becomes, especially for large bearings. If very small bearing loads are expected, please contact NSK for selection of an appropriate bearing.

ANGULAR CONTACT BALL BEARINGS

Single-Row and Matched Angular Contact Ball Bearings

Bore Diameter 90 – 775mm..... B24

Double-Row Angular Contact Ball Bearings

Bore Diameter 100 – 280mm..... B42

Design, Types, and Features

Single-Row Angular Contact Ball Bearings

Since these bearings have a contact angle, they can sustain significant axial loads in one direction together with radial loads. Because of their design, when a radial load is applied, an axial force component is produced; therefore, two opposed bearings or a combination of more than two must be used.

Usually, the cages for large-size angular contact ball bearings are machined brass and guided by the inner ring (Figures 1 and 2) or the balls (Figures 3 and 4).

Figure 1

Figure 2

Figure 3

Figure 4

Table 1 Types and Features of Matched Angular Contact Ball Bearings

Figure	Arrangement	Features
	Back-to-back (DB) (Example) 7220 A DB	Radial loads and axial loads in both directions can be sustained. Since the distance between the effective load centers a_0 is big, this type is suitable if moments are applied.
	Face-to-face (DF) (Example) 7220 B DF	Radial loads and axial loads in both directions can be sustained. Compared with the DB Type, the distance between the effective load centers is small, so the capacity to sustain moments is inferior to the DB Type.

Remarks Regarding the tandem arrangement (DT), please contact **NSK**.

Regarding the angular contact ball bearings used with four-row cylindrical roller bearings for roll necks, refer to page B418.

Double-Row Angular Contact Ball Bearings

This is basically a back-to-back or face-to-face arrangement of two single-row angular contact ball bearings, but their inner or outer rings are integrated into one. Axial loads in both directions can be sustained, so these bearings are used as fixed-end bearings.

Cross-sections of double-row angular contact ball bearings are shown below. The bearings in Figures 5 and 7 have good capacity to sustain moments.

Figure 5

Figure 6

Figure 7

Precautions for Use of Angular Contact Ball Bearings

If the load on angular contact ball bearings becomes too small, or if the ratio of the axial and radial loads for matched bearings exceeds ' e ' (e is listed in the bearings tables) during operation, slippage between the balls and raceways occurs, which may result in smearing. Especially with large bearings since the weight of the balls and cage is high. If such load conditions are expected, please consult with NSK for selection of the bearings.

CYLINDRICAL ROLLER BEARINGS

Single-Row

Cylindrical Roller Bearings

Bore Diameter 100 – 1 320mm B48

Double-Row

Cylindrical Roller Bearings

Bore Diameter 100 – 850mm B66

Design, Types, and Features

Depending on the existence of ribs on their rings, cylindrical roller bearings are classified into the following types.

Types NU, N, NNU, and NN are suitable as free-end bearings. Types NJ and NF can sustain limited axial loads in one direction. Types NH and NUP can be used as fixed-end bearings. Loose rib for NUP inner ring should be mounted so that its marked side faces outward.

If high load capacity is required, Series E cylindrical roller bearings, which have larger rollers and more rollers than usual, are also available.

For standard cylindrical roller bearings, either pressed, machined or pintype cages are used.

Regarding four-row cylindrical roller bearings, refer to page B388.

**Double-Row
Cylindrical Roller Bearings**

Permissible Misalignment

The permissible misalignment of cylindrical roller bearings varies depending on the type and internal specifications, but under normal loads, the angles are approximately as follows:

Width series 0 or 1 0.0012 radian (4')

Width series 2 0.0006 radian (2')

For double-row cylindrical roller bearings, nearly no misalignment is allowed.

Precautions for Use of Cylindrical Roller Bearings

If the load on cylindrical roller bearings becomes too small during operation, slippage between the rollers and raceways occurs, which may result in smearing. Especially with large bearings since the weight of the rollers and cage is high.

If very small bearing loads are expected, please consult with NSK for selection of the bearings.

FULL-COMPLEMENT CYLINDRICAL ROLLER BEARINGS

Single-Row	NCF	Bore Diameter 100 – 670mm	B82
Double-Row	NNCF	Bore Diameter 100 – 500mm	B86
	RS-48E4, RS-49E4	Bore Diameter 100 – 560mm	B90
	RSF-48E4, RSF-49E4	Bore Diameter 100 – 560mm	B90
	RS-50, RS-50NR	Bore Diameter 100 – 400mm	B94

Design, Types, and Features

Cageless, full-complement cylindrical roller bearings have the maximum possible number of rollers and can sustain much heavier loads than cylindrical roller bearings of the same size with cages. On the other hand, high-speed capability is inferior to the bearings with cages.

The open-type single- and double-row bearings are mostly used in general industrial applications at low speed and under heavy load, and the shielded-type double-row bearings are often used in crane sheaves.

Table 1 Features of Various Types

Figure	Type	Design and Features
	NCF	The outer and inner rings and rollers are non-separable since a retaining snap ring is installed at the side opposite the outer ring rib. They can sustain axial loads in only one direction.
	NNCF	NNCF is a double-row version of NCF. They can sustain heavy radial loads.
	RS-48E4 RS-49E4	Double-row outer ring with center rib, two single-row inner rings with ribs. The outer and inner rings and rollers are non-separable since there are two retaining snap rings at the sides of the outer ring. They can sustain an axial load in either direction so they can be used as fixed-end bearings. An oil groove and holes are provided at the center of the outer ring.
	RSF-48E4 RSF-49E4	Double-row outer ring without ribs, double-row inner ring with three ribs. The outer and inner rings and rollers are non-separable since there is a retaining snap ring at the middle of the outer ring. They can be used as free-end bearings. The permissible axial movement is listed in the dimensional tables. An oil groove and holes are provided at the center of the outer ring.
	RS-50 RS-50NR	Both sides shielded, double-row outer ring with center rib, two inner rings with ribs. They can sustain an axial load in either direction. They are prelubricated, but it is possible to replenish the grease through an oil groove and holes in parts mating with the inner rings. If there are snap rings at the outside of the outer ring, this type becomes RS-50NR. They are surface-treated for rust prevention.

Table 3.4 (Page A36)

Outer Ring RotationTable 2 below

Permissible Misalignment

The permissible misalignment of full-complement single-row cylindrical roller bearings is generally 0.0006 radian (2') under normal load.
For double-row bearings, nearly on misalignment is allowed.

Table 2 Fits and Internal Clearances for Full-Complement Cylindrical Roller Bearings

Operating Conditions		Fitting between Inner Ring and Shaft	Fitting between Outer Ring and Housing Bore	Recommended Internal Clearance
Outer Ring Rotation	Thin walled housings and heavy loads	g6 or h6	P7	C 3
	Normal to heavy loads	g6 or h6	N7	C 3
	Light or fluctuating loads	g6 or h6	M7	CN

Internal clearance of RS and RSF type bearings is shown in Table 3.

- Remarks**
- Good quality grease is prepacked in bearings.
 - Grease can be supplied through oil holes in the inner rings.
 - Full-complement cylindrical roller bearings are designed for specific applications, when using them, please contact NSK.

TAPERED ROLLER BEARINGS

Metric Design Single-Row Tapered Roller Bearings

Bore Diameter 100 – 1 900mm B102

Inch Design Single-Row Tapered Roller Bearings

Bore Diameter 100.000 – 1 270.000mm B114

The index for inch design tapered roller bearings is in an appendix (Page C52~C61).

Double-Cup Type Tapered Roller Bearings

KBE (TDO) Bore Diameter 100 – 2 000mm B182

KDE (TDO) Bore Diameter 100 – 1 450mm B246

KF (TNA) Bore Diameter 101.600 – 406.400mm B252

Double-Cone Type Tapered Roller Bearings

KH (TDI) Bore Diameter 100 – 1 290mm B262

KDH (TDI) Bore Diameter 100 – 540mm B282

Design, Types, and Features

Tapered roller bearings are designed so the apices of the cones formed by the raceways of the cone and cup and the conical rollers all coincide at one point on the axis of the bearing. When a radial load is imposed, an axial force component occurs; therefore, it is necessary to use two bearings in opposition or some other multiple arrangement.

Among the metric design tapered roller bearings with high load capacity (HR series), some bearings have the basic number suffixed by J to conform to the specifications of ISO for the cup back face raceway diameter, cup width, and contact angle. Therefore, the cone assembly and cup of bearings with the same basic number suffixed by J are internationally interchangeable.

For the cone assemblies and cups of inch design tapered roller bearings, except four-row bearings, the bearing numbers are approximately formulated as follows:

For tapered roller bearings, besides single-row bearings, there are also various combinations of bearings as listed in Table 1.

The cages of tapered roller bearings are either pressed steel or pin type.

Regarding four-row tapered roller bearings for roll necks, refer to page B344.

Table 1 Design and Features of Combinations of Tapered Roller Bearings

Figure	Arrangement	Examples of Bearing No.	Features
	Back-to-back DB	HR32220JDB+KLR20	Two standard bearings are combined. The bearing internal clearances are adjusted by cone spacers or cup spacers. The cones and cups and spacers are marked with serial numbers and matching symbols. Components with the same serial number can be assembled referring to the matching symbols.
	Face-to-face DF	HR32220JDF+KR	
	KBE(TDO)	100KBE31+L	This type of bearing consists of a double cup and two cone assemblies and a cone spacer. The bearing internal clearance has already been set using the cone spacer, and parts must be combined according to the serial number and matching symbol. The double cup has an oil groove and holes. The KBE type can carry both radial and axial loads, so it can be used as a fixed-end bearing. This is also used frequently on the free end by relieving the shaft elongation/contraction between the cup and housing. This type is basically the same as the back-to-back combination (DB combination) with two single-row tapered roller bearings coupled using cone and cup spacers, but is easier to handle because of fewer parts. This type of bearing is recommended where rigidity is required and strong moments exist.
	KDE(TDO)	100KDE1801+L	This type of bearing is equivalent to the KBE type but with a steeper contact angle. This is used when the axial load is larger than the radial load. The bearing internal clearance has already been set using a cone spacer. The bearing must be assembled according to the serial number and matching symbols.
	KF(TNA)	100KF1701	This type of bearing has one double cup and two cone assemblies. The two cones are in contact face-to-face and there is no cone spacer. Since the bearing internal clearance has already been set, the various parts must be assembled by observing the serial number and matching symbols.
	KH(TDI)	110KH31+K	This type of bearing consists of a double cone assembly and two cups and a cup spacer. Since the bearing internal clearance has already been set using the cup spacer, the parts must be combined according to the serial number and matching symbols. The cup spacer has an oil groove and holes. Since the depth of the oil groove is limited, it is desirable to also provide an oil groove inside the housing.
	KDH(TDI)	100KDH2101+K	This type of bearing is a double-row tapered roller bearing with the rows facing inward but the contact angle is steeper than in the KH type. This consists of a double cone assembly, two cups, and a cup spacer. This is recommended when the axial load is larger than the radial load or an axial load only exists. In certain cases, a spring is provided between the housing shoulder and cup end face for preloading (without using a cup spacer).

Tolerances and Running Accuracy

Metric Design Tapered Roller Bearings..... Table 2.3 (Pages A20 to A23)
 Inch Design Tapered Roller Bearings..... Table 2.4 (Pages A24 to A25)

Inch design tapered roller bearings of J-line (in the bearing tables, bearings preceded by ▲) conform to the following tables. Symbols in the tables are described on page A15. Please contact NSK for details.

Dimensions Related to Mounting

The abutment and fillet dimensions for tapered roller bearings are listed in the bearing tables. Since the cages protrude from the ring face of tapered roller bearings, please use care when designing shafts and housings.

When heavy axial loads are imposed, the shaft shoulder dimensions and strength must be sufficient to support the cone rib.

Permissible Misalignment

The permissible misalignment angle for single-row tapered roller bearings is approximately 0.0009 radian (3').

Precautions for Use of Tapered Roller Bearings

1. If the load of tapered roller bearings becomes too small, or if the ratio of the axial and radial loads for matched bearings exceeds ' e ' (e is listed in the bearing tables) during operation, slippage between the rollers and raceways occurs, which may result in smearing. Especially with large bearings since the weight of the rollers and cage is high. If such load conditions are expected, please consult with NSK for selection of the bearings.
2. Confirm Abutment and Fillet Dimensions D_a and D_b at the time of the HR series adoption.

Bore Diameter 100 – 130 mm

Dynamic Equivalent Load

$P = XF_r + YF_a$	
$F_a/F_r \leq e$	$F_a/F_r > e$
X	Y
1	0
0.4	Y_1

Static Equivalent Load

$P_0 = 0.5F_r + Y_0 F_a$
 When $F_r > 0.5F_r + Y_0 F_a$, use $P_0 = F_r$
 The values of e , Y_1 , and Y_0 are given in the table below.

Bore Diameter 200 – 380 mm

Dynamic Equivalent Load

$P = XF_r + YF_a$	
$F_a/F_r \leq e$	$F_a/F_r > e$
X	Y
1	0
0.4	Y_1

Static Equivalent Load

$P_0 = 0.5F_r + Y_0 F_a$
When $F_r > 0.5F_r + Y_0 F_a$, use $P_0 = F_r$
The values of e , Y_1 , and Y_0 are given in the table below.

Bore Diameter 530 – 950 mm

Dynamic Equivalent Load

$$P = X F_r + Y F_a$$

$F_a/F_r \leq e$		$F_a/F_r > e$	
X	Y	X	Y
1	0	0.4	Y_1

Static Equivalent Load

$$P_0 = 0.5 F_r + Y_0 F_a$$

When $F_r > 0.5 F_r + Y_0 F_a$, use $P_0 = F_r$ The values of e , Y_1 , and Y_0 are given in the table below.

Note ▲ The tolerances are listed in tables 2 to 4 on page B 99.

Bore tolerances are listed in table 2.4 on page A24, but their tolerances are negative.

Bore Diameter 101.600 – 106.362 mm

Dynamic Equivalent Load

$P = XF_r + YF_a$	
$F_a/F_r \leq e$	$F_a/F_r > e$
X	Y
1	0
0.4	Y_1

Static Equivalent Load

$P_0 = 0.5F_r + Y_0 F_a$
 When $F_r > 0.5F_r + Y_0 F_a$, use $P_0 = F_r$
 The values of e , Y_1 , and Y_0 are given in the table below.

Bore Diameter 346.075 – 355.600 mm

Dynamic Equivalent Load

$P = X F_r + Y F_a$			
$F_a/F_r \leq e$	$F_a/F_r > e$		
X	Y	X	Y
1	0	0.4	Y_1

Static Equivalent Load

$P_0 = 0.5 F_r + Y_0 F_a$
When $F_r > 0.5 F_r + Y_0 F_a$, use $P_0 = F_r$
The values of e , Y_1 , and Y_0 are given in the table below.

Bore Diameter 546.100 – 660.400 mm

Dynamic Equivalent Load

$P = XF_r + YF_a$	
$F_a/F_r \leq e$	$F_a/F_r > e$
X	Y
1	0
0.4	Y_1

Static Equivalent Load

$P_0 = 0.5F_r + Y_0F_a$
When $F_r > 0.5F_r + Y_0F_a$, use $P_0 = F_r$
The values of e , Y_1 , and Y_0 are given in the table below.

SPHERICAL ROLLER BEARINGS

Spherical Roller Bearings

Cylindrical Bores, Tapered Bores

Bore Diameter 100 – 1590mm B290

Design, Types, and Features

These bearings have two rows of barrel-shaped rollers between the inner ring, which has two raceways, and the outer ring that has one spherical raceway. Since they have self-aligning capability, if there is deflection of the shaft or housing or misalignment of their axes, it is automatically corrected so excessive force is not applied to the bearings.

Some bearings have tapered bores and may be mounted directly on tapered shafts or cylindrical shafts using adapters or withdrawal sleeves.

As shown in Table 1, various types of standard spherical roller bearings are available.

Table 1 Types and Features of Spherical Roller Bearings

Types	Cross Section	Inner Ring	Rollers	Cages	Guide Ring	Features
EA		No central integral rib or side ribs	Symmetrical	Two piece pressed steel	None	Higher load capacity Lower torque
C,CD		No central integral rib or side ribs	Symmetrical	Two piece pressed steel	Yes	Higher load capacity
CA		Side ribs	Symmetrical	One piece machined brass	Yes	Higher load capacity

All spherical roller bearings (the bearing numbers are suffixed with E4) have an oil groove and holes in the outer ring to supply lubricant.

To use bearings with oil grooves and holes, it is recommended to provide an oil groove in the housing bore, since the depth of the groove in the bearing is limited. The number and dimensions of the oil groove and holes are shown in Tables 2 and 3.

When bearings with a hole for a locking pin to prevent outer ring rotation are required, please inform NSK.

Table 2 Dimensions of Oil Grooves and Holes

Nominal Outer Ring Width C		Oil Groove Width W	Hole Diameter d_{OH}	Units:mm	
over	incl			over	incl
40	50	7	4

- Tolerances and Running Accuracy** Table 2.2 (Pages A16 to A19)
- Recommended Fits** Table 3.2 (Page A35)
Table 3.4 (Page A36)
- Internal Clearance** Table 3.12 (Page A42)

Permissible Misalignment

The permissible misalignment of spherical roller bearings varies depending on the size and load, but it is approximately 1° to 2.5° with average loads.

Precautions for Use of Spherical Roller Bearings

If the load on spherical roller bearings becomes too small, or if the ratio of the axial and radial loads exceeds 'e' (e is listed in the bearing tables) during operation, slippage between the rollers and raceways occurs, which may result in smearing. Especially with large bearings since the weight of the rollers and cage is high. If such load conditions are expected, please consult with NSK for selection of the bearings.

Bore Diameter 100 – 150 mm

Cylindrical Bore

Tapered Bore

**Dynamic Equivalent Load**

$P = XF_r + YF_a$	
$F_a/F_r \leq e$	$F_a/F_r > e$
X	Y
1	Y_3
0.67	Y_2

Static Equivalent Load

$P_0 = F_r + Y_0 F_a$
The values of e , Y_2 , Y_3 , and Y_0 are given in the table below.

Design, Types, and Features

Thrust Ball Bearings

Thrust ball bearings are composed of washer-like bearing rings with raceway grooves. Single-direction thrust ball bearings can sustain an axial load in only one direction.

Pressed cages are usually used, but larger ones are machined brass. The basic load ratings listed in the bearing tables are based on the standard cage type. If the type of cage is different for bearings with the same number, the number of balls may vary. In such a case, the load rating will differ from the one listed in the bearing tables.

Table 1 Standard Cages for Thrust Ball Bearings

Pressed Steel	Machined Brass
51118 – 51152X	51156X – 511/630X
51218 – 51236X	51238X – 512/630X
51318 – 51336X	51338X – 51392
51418X	51420X – 51448X

Cylindrical Roller Thrust Bearings

These are thrust bearings containing cylindrical rollers. They can sustain only axial loads, but they are suitable for heavy loads and have high axial rigidity. The cages are machined brass.

Tapered Roller Thrust Bearings

These are thrust bearings containing tapered rollers. TT-type bearings, which have a rib on the housing washer, can accurately guide the shaft in the radial direction. TTF-type bearings, which have no rib on the housing washer, can tolerate some eccentricity during operation.

Spherical Thrust Roller Bearings

These are thrust bearings containing barrel-shaped rollers (convex rollers). They have a self-aligning capability and are free of any influence of mounting error or shaft deflection. Besides the original type, the E type with pressed cages, and the EM type with machined brass cage for high load capacity are also available. Their bearing numbers are suffixed by E.

Since there are several places where lubrication is difficult, such as the area between the roller heads and shaft washer rib, the sliding surfaces between cage and guide sleeve, etc., oil lubrication should be used even at low speed.

The cages in the original type are machined brass.

Tolerances and Running Accuracy

Spherical Thrust Roller Bearings

For inch design tapered roller thrust bearings, please contact **NSK**.

Dimensions Related to Mounting

The dimensions related to mounting of spherical thrust roller bearings are listed in the Bearing Table.

If the bearing load is heavy, it is necessary to design the shaft shoulder with ample strength in order to provide sufficient support for the shaft washerrib.

Permissible Misalignment

The permissible misalignment of spherical thrust roller bearings varies depending on the size, but it is approximately 1° to 2° with average loads.

Minimum Axial Load

It is necessary to apply some axial load to thrust bearings to prevent slippage between the rolling elements and raceways. For more details, please contact **NSK**.

⁽¹⁾ For this bearing, the dimensional symbols are defined by Figure TTF-1.

Bore Diameter 100 – 260 mm

**Dynamic Equivalent Load**

$$P = 1.2F_r + F_a$$

Static Equivalent Load

$$P_0 = 2.8F_r + F_a$$

However, $F_r/F_a \leq 0.55$
most be satisfied.

ROLLING BEARINGS FOR STEEL MILLS

Design, Types, and Features

Roll Neck Bearings

Four-Row Tapered Roller Bearings, KV (TQO)

Roll neck bearings for rolling mills are limited in size by the roll neck diameter and minimum roll diameter. Four-row tapered roller bearings are designed to have the highest possible load rating within this limited space.

This type of bearing has two double-cone assemblies, two cups, one double cup, and three spacers. The bearings have their internal clearance adjusted for each set, so it is necessary to assemble them correctly in accordance with their serial numbers and matching symbols.

This type of bearing is loosely fitted on its roll neck to facilitate mounting and disassembly. Accordingly, the roll neck must be lubricated to prevent scoring between the roll neck and bore surface caused by creep. For this reason and to prevent wear and seizure of the side surfaces of the cone and cone spacer, oil grooves are provided on one side of each cone and both sides of the cone spacer. The double cup and cup spacers are provided with an oil groove and holes.

Any hairline crack in the cone side caused by creep may result in its braking. Therefore, to prevent this and to improve the impact resistance, this type of bearing is usually made of carburized steel.

The cage is either a window type or pin type.

Bearings for oil mist lubrication are available. They have nozzle holes in the cup spacers, O-ring grooves, and O-rings in the cups.

Sealed-Clean Four-Row Tapered Roller Bearings, KVE

These are basically the same as four-row tapered roller bearings. Their features are as follows:

- Long fatigue life
- Large reduction in lubrication grease consumption
- Extension of chock overhaul intervals and reduction of maintenance cost
- Bearing surrounding area remains cleaner

There are two basic types; one is a two seal type and the other is a four seal type. (Refer to Figures 3 and 4 on Page B343)

Four-Row Cylindrical Roller Bearings, RV

Four-row cylindrical roller bearings are mainly used on the roll necks of hot or cold rolling mills used for forming blooms, plates, and other stock. There are many variations of the bearings; the inner and outer rings may or may not have ribs, the inner ring may be in one or two pieces, the bore may be cylindrical or tapered, and other variations are available.

All four-row cylindrical roller bearings can sustain only radial loads and no axial loads; therefore, they must be used in combination with thrust bearings such as angular contact ball bearings, tapered roller bearings.

Since the inner ring raceway is generally cylindrical and without ribs, it can be separated from the outer ring assembly. This makes it possible to tightly fit the inner ring on the roll neck and regrind the roll with the inner ring raceway as the reference surface in order to minimize the roll runout. Some special bearings have an oversized inner ring raceway that allows raceway grinding after fitting on the roll neck. This permits grinding the raceway and roll surface together to further minimize runout. Such bearings are widely used where high accuracy is required.

With the inner ring tightly fit on the roll neck, there is no danger of creep, even at high speeds. Oil mist lubrication is possible with fittings and an O-ring in the outer ring.

Double-Cone Tapered Roller Bearings, KDH (TDI)

Refer to Page B98.

Some variations of the cone are available such as a notch to prevent creep. For details, contact NSK.

Double-Direction Tapered Roller Thrust Bearings, TFD

The axial clearance or preload of the bearings is adjusted using spacers or springs.

Single-Row Deep Groove Ball Bearings

Refer to Page B5.

Matched Angular Contact Ball Bearings

Refer to Page B21.

TFX

TFV

Tapered Roller Thrust Bearings for Adjusting Screws

These bearings, which are used at the ends of the adjusting screws of rolling mills, are full complement types for maximum load capacity. The face profile of the shaft washer of the TFX type is convex and that of the TFV type is concave. Holes or threads are provided in the inner or outer ring for lifting as shown in the figures. Since some bearings have special profiles, boundary dimensions, and tolerances, contact NSK when selecting one of these bearings.

3PL

2U

2S

Back-Up Roll Bearings for Sendzimir Mills

The bearings for this application have very thick outer rings compared with ordinary bearings because the bearing periphery serves as the back-up roll. Since these bearings must maintain high precision under heavy load, they are designed to have the maximum load capacity. The types available are cylindrical roller bearings, tapered roller bearings, spherical roller bearings, and needle roller bearings, with cylindrical roller bearings being most popular.

Since 3PL type cylindrical roller bearings and needle roller bearings cannot sustain axial loads, plastic thrust rings are used for the axial loads.

Several back-up roll bearings are mounted on one shaft and their outer ring peripheries serve as the back-up roll. Therefore, the outer ring radial runout and thickness variation after mounting are strictly controlled.

If the outer ring peripheries become rough, the bearings can be reused by regrinding the surface.

Roll Arrangement of a 20-high Sendzimir Mill

8 Back-Up Assemblies Marked A, B, C, D, E, F, G, H

Precautions for Mounting

Four-Row Tapered Roller Bearings

Four-row tapered roller bearings often have eight parts as shown below (two double cones with rollers, one double cup, two single cups, and three spacers). Each part is marked with a common serial number and matching symbol to indicate the assembly sequence. The common serial numbers (e.g., AE-11) prevent the mixing of parts between bearings. The assembly symbols, which consist of one or two letters, follow the serial numbers and indicate the position of each part in the assembled bearing. It is important to carefully observe these markings because an improper combination can result in an excessively small internal clearance that may cause seizure or an excessively large clearance that may cause premature fatigue due to a reduced loaded zone.

Example of serial numbers and matching symbols on four-row tapered roller bearings.

The sides of the cups are also marked with four load position numbers (① through ④) spaced at 90° intervals around each cup to show the proper angular orientation in an assembled bearing. To prolong bearing life, these load position numbers should be indexed 90° during remounting following maintenance.

Load Position Numbers on Four-Row Bearing Outer Rings

Sealed-Clean Four-Row Tapered Roller Bearings

When using Sealed-Clean bearings, it is important to provide proper water drain holes at both ends and to place an O-ring between the bearing retaining ring and roll neck. Since this bearing is mounted or dismounted as an assembly as shown in the photo below, use the proper lifting tools.

Consult NSK regarding the recommended greases most appropriate for Sealed-Clean four-row tapered roller bearings.

Four-Row Cylindrical Roller Bearings

Four-row cylindrical roller bearings have either cylindrical bores or tapered bores and are mounted on the shaft with interference. As shown in the figure below, four-row cylindrical roller bearings have serial numbers and matching symbols marked on the various parts. In this example, matching symbols are marked on two outer rings, one middle and two outer loose ribs, and four cages with rollers. It is important for all these parts to be correctly positioned when mounting them in their chock by paying attention to the matching symbols.

Matching Symbols

Note ⁽¹⁾ Refer to page B 387

The letter "M" indicates bearing for oil mist lubrication.

The letters "SP" indicate a special design. Please consult NSK for details.

Note * Bearings marked * are inch design.

Remarks 1. Double-row tapered roller bearings with the suffix +K have outer ring spacers.

2. C_a of the basic load ratings is not the limiting load. For this bearing type, apply a preload.

TRIPLE-RING BEARINGS FOR PAPER MAKING MACHINES

Bore Diameter 180 – 380mm B438

Design, Types, and Features

Controlled crown rolls (CC rolls) having adjustable camber are used extensively for bottom press rolls and bottom calender rolls. Earlier designs used two tapered roller bearings with a spherical roller bearing. Recently, triple-ring bearings have been used to simplify the surrounding structure and installation.

Two spherical roller bearings (or spherical roller bearing and cylindrical roller bearing) are combined into one unit. Triple-ring bearings have three bearing rings (Inner, intermediate, and outer rings).

- Bearings have high load capacity (symmetrical rollers and no center rib).
- Inner bearing has no floating guide ring which further improves the load capacity.
- Ultra-clean carburizing grade bearing steel is used in critical components.
- High precision dimensional tolerances (suffix UPA).
- Specially designed inner ring and cage improve the inner bearing lubrication.
- Oil holes and grooves in the inner and outer rings are standard.

CROSSED ROLLER BEARINGS FOR INDUSTRIAL ROBOTS

Bore Diameter 100 – 600mm B444

Design, Types, and Features

Crossed roller bearings are thin-cross section bearings consisting of one inner ring, a two-part outer ring, cylindrical rollers, and separators. The rollers are alternately oriented at right angles to each other and kept apart by separators.

One bearing can sustain both radial and axial loads and also strong moments. Since the load capacity is high and they are both light and compact, they are commonly used in the rotating joints of robots.

Preloading of the bearings increases rigidity and improves positioning accuracy. Therefore, they are suitable for the support bearings of indexing mechanisms, rotary tables, etc. that are generally required to have high rigidity.

Sealed crossed roller bearings are prelubricated with lithium grease and can be used without maintenance.

Since the internal clearances in **NSK** crossed roller bearings are factory adjusted, they can be installed directly without trouble some shim adjustment. Simple mounting of bearings is possible since the outer ring parts are inseparable.

An example of the composition of bearing numbers is shown below:

Recommended Fits and Internal Clearances

Table 1 Recommended Fits

Internal Clearance	Operating Conditions		Shaft	Housing
C8	Rotating Inner Ring	Normal Loads	$h5$ (Target Interference 0 to 5 μm)	$H6$ (Target Clearance 0 to 10 μm)
		Shock or Vibration		
	Rotating Outer Ring	Normal Loads	$g5$ (Target Clearance 0 to 10 μm)	$JS6$ or $J6$ (Target Interference 0 to 5 μm)
		Shock or Vibration		
C1	Rotating Inner Ring	Normal Loads	$js5$ or $j5$	$H6$
		Shock or Vibration	$k5$	$JS6$ or $J6$
	Rotating Outer Ring	Normal Loads	$g6$	$JS6$ or $J6$
		Shock or Vibration	$h5$	$k6$

Remarks If the preload is high, the fits in parentheses () are recommended.

Table 2 Internal Clearances

Units : μm

Bore diameter <i>d</i> (mm)	Internal Clearances				
	C8 (‐)		C1		
over	incl	min.	max.	min.	max.
100	120	‐15	0	10	30
120	140	‐15	0	10	35

Split Bearings for Tunnel Excavating Shields

Features

- High reliability proven by successful performance worldwide
- Optimum design derived from extensive experience and computerized analyses
- Advanced production equipment, skilled workmanship, and systematic quality assurance
- High quality ring and cage materials

Excavating shield equipped with NSK bearing for Strait of Dover (Pas de Calais) between United Kingdom and France

Slewing Bearings

NSK supplies a wide range of types and sizes of slewing bearings that are not listed here. Contact NSK for information concerning them.

The figure below is a typical triplex cylindrical roller bearing with an internal gear. Other types with external gears and without gears are also available.

Ladder Bearings for Convertors

Features

TRL ladder bearings are linear motion bearings consisting of a single or double row of cylindrical rollers between flat raceways. They are used to relieve the axial displacement of the trunnion bearings and housings caused by heat.

Super-Large Double-Split Bearings for Convertor Trunnions

Features

- double-split bearing for the driven convertor trunnion enables changing the bearing without removing the bull gear.
- Large reduction in bearing replacement time and expense
- Substitution is possible within the space required for standard bearings.

Bearing Numbers	Boundary Dimensions (mm)					Basic Load Ratings (kN)	
	d	D	C	B	B ₁	C _r	C _{0r}

Double-Split Bearing Units for Segmented Drive Rolls in Continuous Casters (Full-Complement Double-Split Cylindrical Roller Bearings)

Features

- Integrated full-complement double-split cylindrical roller bearings with high load capacity within a limited space
- Three seals for maximum protection; special seal, self-lubricating seal, and labyrinth seal
- Smooth self-aligning capability prevents edge loads on rollers
- Direct inner ring coupling for high precision and easy handling
- Sufficient space for water jacket enables effective cooling.

Segmented Drive Roll

Sealed-Clean Bearings for Guide Rolls and Pinch Rolls in Continuous Casters

Features

- Special design of flexible seals assures excellent sealing and smooth axial movement of the seal lips to allow roll bending and thermal elongation.
- Special grease has been developed to lubricate continuous caster bearings. Since its heat resistance, pressure resistance, and rust preventive capability are excellent, bearings operate for a long time without maintenance.

Sealed-Clean Bearings for Chain Conveyors

Features

- More effective sealing with side contact seals
- Improved shock resistance by adopting case-hardened steel for the outer rings
- Long periods of operation without replenishing the grease are possible because of the high quality grease supplied.

Sealed-Clean Bearings for Sintering Equipment

Features

Pallet Wheel Bearings

Internal oil seals on both sides of the bearing and an external seal with a unique lip design on the inboard side prevent the entry of foreign matter and assure maintenance-free operation and long life.

Bearings for Inboard Rollers

Existing journal (sliding) bearings are being replaced by sealed cylindrical roller bearings because they require less maintenance and reduce cost.

Roll Units for Tension Levelers

Features

Exclusive Roll Units Continuous Galvanizing Lines and Continuous Pickling Lines

Work Roll and Intermediate Roll Units

Rolls units with integrated thrust blocks at both ends offer high precision and high speed capability.

Backup Roll Units

High-accuracy, low-torque backup roll units with highly effective seals

Bearing Heaters

Features

- **Fast, Uniform Heating**
Induction heating reduces bearing mounting time and cost.
 - **No Oil Tanks Required**
Since no oil is necessary, there can be no spills or other mess and bearings remain clean.
 - **Safe Operation**
Since there are no flames, there is no fire hazard, and an internal circuit breaker guards against an electrical short.
 - **Compact and Light**
Most NSK Bearing Heaters are light enough to be carried easily and used anywhere.
 - **Automatic Temperature Control**
A thermostatic control can be set at any temperature up to 200°C. When the desired level is reached, a buzzer sounds and constant temperature is maintained.
 - **Automatic Demagnetizing**
When the heating is finished, the bearing is quickly and automatically demagnetized.
 - **Bearing Rest**
A convenient rest supports the bearing and allows it to be easily positioned.
 - **Versatility**
Besides bearings, other metallic rings such as inner ring spacers can also be heated for shrink fitting or for other purposes.

Bearing Monitors

NSK Bearing Monitors measure and process the vibrational acceleration of bearings to give early warning of trouble and allow rationalization of maintenance.

Features

- Instruments detect various kinds of abnormalities.
 - Readings are in basic g units ($1g=9.8m/sec^2$).
 - Various output circuits allow further analysis.
 - Model NB-4 is a pocket-size type utilizing microelectronics. Besides checking bearing, it is convenient for general vibration measurements.

			Water Column	mH ₂ O	$1/(9.806\ 65 \times 10^3)$
			Mercury Column	mmHg	$760/(1.013\ 25 \times 10^5)$
			Torr	Torr	$760/(1.013\ 25 \times 10^5)$
			Bar	bar	10^{-5}
			Atmosphere	atm	$1/(1.013\ 25 \times 10^5)$
Energy	Joule (Newton · meter)	J (N · m)	Erg	erg	10^7
			Calorie (International)	cal _{IT}	$1/4.186\ 8$
			Kilogram-force meter	kgf · m	$1/9.806\ 65$
			Kilowatt hour	kW · h	$1/(3.6 \times 10^6)$
			French horse power hour	PS · h	$\approx 3.776\ 72 \times 10^{-7}$
Work	Watt (Joule per second)	W (J/s)	Kilogram-force meter per second	kgf · m/s	$1/9.806\ 65$
			Kilocalorie per hour	kcal/h	$1/1.163$
			French horse power	PS	$\approx 1/735.498\ 8$
Viscosity, Viscosity Index	Pascal second	Pa · s	Poise	P	10
Kinematic Viscosity, Kinematic Viscosity Index	Square meter per second	m ² /s	Stokes	St	10^4
			Centistokes	cSt	10^6
Temperature	Kelvin, Degree celsius	K, °C	Degree	°C	(See Note (1))
Electric Current, Magnetomotive Force	Ampere	A	Ampere	A	1
Voltage, Electromotive Force	Volt	V	(Watts per ampere)	(W/A)	1
Magnetic Field Strength	Ampere per meter	A/m	Oersted	Oe	$4\pi/10^3$
Magnetic Flux Density	Tesla	T	Gauss	Gs	10^4
			Gamma	γ	10^9
Electrical Resistance	Ohm	Ω	(Volts per ampere)	(V/A)	1

Note (1) The conversion from TK into °C is $\theta = T - 273.15$ but for a temperature difference, it is $\Delta T = \theta - \Delta \theta$. However, ΔT and $\Delta \theta$ represent temperature differences measured using the Kelvin and Celsius scales respectively.

Remarks The names and symbols in () are equivalent to those directly above them or on their left.

Example of conversion 1N=1/9.806 65kgf

Appendix Table 2 N-kgf Conversion Table

(Method of using this table) For example, to convert 10N into kgf, read the figure in the right kgf column adjacent to the 10 in the center column in the 1st block. This means that 10N is 0.10197kgf. To convert 10kgf into N, read the figure in the left N column of the same row, which indicates that the answer is 98.066N.

$$1 \text{ N} = 0.1019716 \text{ kgf}$$

$$1 \text{ kgf} = 9.80665 \text{ N}$$

N		kgf	N		kgf	N		kgf

Appendix Table 3 kg-lb Conversion Table

(Method of using this table) For example, to convert 10kg into lb, read the figure in the right lb column adjacent to the 10 in the center column in the 1st block. This means that 10kg is 22.046lb. To convert 10lb into kg, read the figure in the left kg column of the same row, which indicates that the answer is 4.536kg.

$$1 \text{ kg} = 2.2046226 \text{ lb}$$

$$1 \text{ lb} = 0.45359237 \text{ kg}$$

kg		lb	kg		lb	kg		lb

Appendix Table 4 °C-°F Conversion Table

(Method of using this table) For example, to convert 38°C into °F, read the figure in the right °F column adjacent to the 38 in the center column in the 2nd block. This means that 38°C is 100.4°F. To convert 38°F into °C, read the figure in the left °C column of the same row, which indicates that the answer is 3.3°C.

Appendix Table 8 Physical and Mechanical Properties of Materials

Materials	Specific Gravity	Coefficient of Linear Expansion ($0^{\circ}\sim100^{\circ}\text{C}$) (K^{-1})	Hardness (Brinell)	Modulus of Direct Elasticity (MPa) (kgf/mm^2)	Tensile Strength (MPa) (kgf/mm^2)	Yield Point (MPa) (kgf/mm^2)	Elongation (%)
Bearing Steel (hardened)	7.83	12.5×10^{-6}	650~740	208 000 (21 200)	1 570~1 960 (160~200)	—	—
Martensitic Stainless Steel SUS 440C	7.68	10.1×10^{-6}	580	200 000 (20 400)	1 960 (200)	1 860 (190)	—
Mild Steel (C=0.12~0.20%)	7.86	11.6×10^{-6}	100~130	206 000 (21 000)	373~471 (38~48)	216~294 (22~30)	24~36
Hard Steel (C=0.3~0.5%)	7.84	11.3×10^{-6}	160~200	206 000 (21 000)	539~686 (55~70)	333~451 (34~46)	14~26
Austenitic Stainless Steel SUS 304	8.03	16.3×10^{-6}	150	193 000 (19 700)	588 (60)	245 (25)	60
Gray Iron FC 200	7.3	10.4×10^{-6}	223	98 100 (10 000)	Min. 200 (20)	—	—
Cast Iron Spheroidal graphite Iron FCD 400	7.0	11.7×10^{-6}	Max. 201		Min. 400 (41)	—	Min. 12
Aluminum	2.69	23.7×10^{-6}	15~26	70 600 (7 200)	78 (8)	34 (3.5)	35
Zinc	7.14	31×10^{-6}	30~60	92 200 (9 400)	147 (15)	—	30~40
Copper	8.93	16.2×10^{-6}	50	123 000 (12 500)	196 (20)	69 (7)	15~20
Brass (Annealed)	8.5	19.1×10^{-6}	45	103 000 (10 500)	294~343 (30~35)	—	65~75
Brass (Machined)			85~130		363~539 (37~55)	—	15~50

Remarks The hardness of hardened bearing steel and martensitic stainless steel is usually expressed using the Rockwell C Scale, but for comparison, it is converted into Brinell hardness.
